Radon in Homes in England: 2016 Data Report

About Public Health England

Public Health England exists to protect and improve the nation's health and wellbeing, and reduce health inequalities. We do this through world-class science, knowledge and intelligence, advocacy, partnerships and the delivery of specialist public health services. We are an executive agency of the Department of Health, and are a distinct delivery organisation with operational autonomy to advise and support government, local authorities and the NHS in a professionally independent manner.

Radon in Homes in England: 2016 Data Report

Rees D M, Miller C A

Abstract

This report provides a summary of just over 525,000 radon measurements made in homes in England between 1980 and 2015. It updates the previous data review published in 2011 and complements the radon atlas of England which was published in 2007. Results are displayed in summary tables for a range of administrative areas, postcodes and NHS bodies and are accompanied by a short descriptive text.

1 Introduction

Radon is a naturally occurring radioactive gas that is present in all homes and is the major source of ionising radiation exposure to the UK population. Where high levels are found, a radon Action Level (200 Bq m⁻³) is used to advise householders on the need to take remedial action in the home. For further information about the sources and properties of radon, its health effects and the UK control strategy, please consult either the general Public Health England (PHE) website www.gov.uk/government/organisations/public-health-england or the dedicated PHE radon website at www.ukradon.org.

This report summarises and presents the data that PHE holds from just over 525,000 radon measurements conducted in homes in England in the period between 1980 and 2015.

Results are presented in tabular format to illustrate the range and distribution of radon levels in local Government administrative areas down to electoral ward. Results are also presented using the postcode system down to sector level and by NHS health authority and clinical commissioning group. To preserve confidentiality, results are not reported when there are fewer than five measurements in the grouping.

This report complements the indicative atlas of England and Wales (Miles et al, 2007) which shows the radon potential in map format and it updates and replaces the data tables contained within the previous result summary (Rees et al, 2011).

2 Measurements

Radon measurements are normally made with two passive integrating detectors in each home - one in the main living area and the other in a regularly used bedroom. This reflects the parts of the home that are most occupied. The detectors are left in place for three months and the individual results combined by applying both occupancy ratios to reflect typical occupancy patterns and seasonal correction factors to reflect typical seasonal variations in radon levels (Miles and Howarth, 2008) thereby giving an estimate of the annual average for exposure from radon in the individual home. In some homes multiple measurements have been recorded, for example when radon remedial works are undertaken. Throughout this report only the earliest valid measurement for an address is used. The results rely on the householder placing the detectors in accordance with our instructions.

The measurement results contained within this report have been collected from various measurement programmes conducted by PHE (and previously HPA and NRPB) from 1980 through to 2015. These surveys were undertaken with the aim of finding homes with high radon levels within the radon affected areas identified through the publication of radon maps (Lomas et al, (1996), Green et al (2002), Miles et al (2007)). These surveys were not designed to be statistically representative of large areas. To date only one fully representative UK survey has been undertaken. That national survey (Wrixon et al, 1988) was designed to obtain a population weighted sample of results throughout the UK. The results from that survey remain the best estimate of the average domestic radon exposure for England.

Within previously published reports, result summaries were prepared alongside radon maps and due to positional uncertainties a small number of results were excluded from the mapping and the associated data. That constraint is not present in this report and therefore allows a more comprehensive summary of the results than in previous publications. Due to data cleaning some results that have appeared in previous reports are no longer contained within this report as information now available indicates that the measurement is invalid.

3 Results

Tables 1 to 9 show the number and distribution of radon measurements in homes grouped by different boundary systems relating to local authorities, unitary authorities, postcodes and NHS bodies.

The tables show

- The total number of homes in the area
- How many homes in the area have PHE radon measurements
- The arithmetic and geometric average of the measured radon levels in the area
- The highest individual measurement in the area
- The number of homes measured at or above the Action Level in the area

The data is available in digital format for download on the gov.uk website.

Table of Contents

Table 1 - Results by each home nation

Table 2 - Results in England by rural and metropolitan county

Table 3a - Results in England by local authority

Table 3b - Results in England by unitary authority

Table 4a - Results in England by electoral ward for local authorities

Table 4b - Results in England by electoral ward for unitary authorities

Table 5 - Results in England by postcode area

Table 6 - Results in England by postcode district

Table 7 - Results in England by postcode sector

Table 8 - Results in England by NHS health authority

Table 9 - Results in England by NHS clinical commissioning group

General notes

- In tables 1 - 9 the estimates of the number of addresses are derived from the Royal Mail® Postal Address File (PAF®). PAF also provides administrative and health authority information for each delivery point in Great Britain and Northern Ireland
- To avoid undue precision, all numbers other than averages have been rounded to two or three significant figures

- For tables 4a, 4b, 6 and 7 only, where there are fewer than 5 results for a particular grouping the data are not presented. For this reason, the sum of the sub-totals for a set of constituent areas may be slightly less than the total for the aggregate data
- Royal Mail® postcodes have four parts and read from left to right, representing progressively smaller groups of addresses
- Postcodes have two elements (of two parts each) separated by a space
- The largest part (both in terms of geographical area and addresses) is the postcode area
- The postcode area is given the first one or two alphabetical letters of the postcode and refers to the post town (for example, OX for Oxford). A small number of postcode areas have a single letter representing the post town (for example, B for Birmingham)
- Postcode districts consist of the postcode area and the numbers that make up the first element of the full postcode. The postcode district of OX11 0RQ would be OX11
- Postcode sectors consist of the postcode district together with the numerical part of the second element. The postcode sector of OX11 0RQ would be OX11 0
- Neither postcode districts nor sectors are aligned to administrative boundaries. A single postcode district or sector may cover two or more local authorities or electoral wards
- There are 103 postcode areas in England although several cross the borders with either Scotland or Wales. Only addresses with a CH, HR, LD, LL, NP or SY postcode that lie in England have been included, addresses in Wales with these postcodes have been excluded. For the TD postcode area only addresses in England have been included, those in Scotland have been excluded. Postcode areas that lie mainly in Wales or Scotland, and which have only very small numbers of addresses in England, have been excluded to preserve privacy

4 Conclusions

This report presents summary results of the distribution of measured radon levels in homes in England, grouped by various geographical areas. It complements the full radon probability dataset described elsewhere (Miles et al, 2007).

While the data in this report give the distribution of measured radon levels in different areas the results are biased towards measurements in targeted areas with higher radon probability. The probability of any address exceeding the Action Level is best assessed using the full radon probability dataset, accessible through www.ukradon.org. The actual level of radon at any specific address can only be determined through an appropriate radon measurement.

5 Acknowledgements

We wish to thank present and past members of the radon team at PHE and previously HPA and NRPB for all their efforts.

The data reported were collected during many surveys carried out on behalf of the government, local councils, landlords and individual householders.

7 Glossary of terms

Averages. Within this report numerical data are presented in two ways: arithmetic average and geometric average. The arithmetic average is derived from summing the results by grouped unit then dividing by the number of results. The geometric average is the nth root of the product of n results.

Becquerel. Symbol Bq. The SI unit of radioactivity and measures the activity of a radionuclide transformation or decay. An activity of 1 becquerel denotes an activity of 1 nuclear transformation or decay per second.

Becquerel per cubic metre of air. Symbol Bq m^{-3} . A quantity indicating the amount of radionuclide transformation in each cubic metre of air per second. Often referred to as the activity concentration.

Population-weighted average. The value obtained for the analysis of a sample selected in which each member of the population has an equal chance of inclusion in the sample. In the specific case of the UK National Radon Survey (Wrixon et al 1988), the population was every domestic address in the UK and a systematic sample was taken, ie every Nth address, from all domestic addresses listed in postcode order.

Radon Action Level. The activity concentration of radon in UK homes above which reduction is advised. Its value, expressed as the annual average radon gas concentration in the home, is 200 Bq m⁻³.

Radon Affected Areas. Parts of the country with a 1% or greater probability of present or future homes being at or above the Action Level.
