

# Interchange

**Providing systems that allow our members to be better connected and gain broad experience.**

This theme is about allowing our scientists and engineers to connect and gain experience and knowledge from **across government, industry and academia.**

To make interchange easier, we want to standardise how sectors, departments and professional institutions refer to and capture their expertise. We also want to support and grow secondment programmes that currently work, like **STEM Futures**, which has placed 8 people so far in industry placements with reduced effort for departments using a useful framework.

Go to the GSEP Strategy for a case study on how we are working with public sector research establishments to align skills capture.

Agree with departments how GSE technical capabilities are referred to by October 2022

Scope and analyse existing knowledge interchange programmes by April 2022

Over the next year, we are going to evaluate placement and knowledge-sharing schemes from across government and see how we can build on those found.

Another big part of this aim is to connect our members, both to build capability, and to **increase a sense of belonging**. We are investigating a hosting platform just for GSE members where they will be able to connect and share information.
