The Building Regulations 2010

Amendments to the Approved Documents

This document contains amendments to the following Approved Document:

Approved Document B: Fire safety
Volume 1 – Dwellings
Volume 2 – Buildings other than dwellings
2019 edition incorporating the 2020 amendments

June 2022

For use in England
The Building Regulations 2010

Introduction

This document sets out amendments to guidance previously published in Approved Document B: Fire safety, Volume 1 – Dwellings and Volume 2 – Buildings other than dwellings, 2019 edition incorporating the 2020 amendments. These amendments will be incorporated in the online available Approved Document B Volume 1 and Volume 2 as from 1 December 2022. Hard copy versions from before that date will need to be read alongside the amendments listed in this document. You should always check the online version to know that you are looking at the most up to date version.

The changes highlighted in this amendment booklet take effect on 1 December 2022 for use in England. The 2019 edition incorporating the 2020 amendments will continue to apply where a building notice or an initial notice has been given to, or full plans deposited with, a local authority before 1 December 2022 and either the building work to which it relates:

a. has started before that day; or
b. is started within the period of six months beginning on that day.

Please note that ‘building notice’, ‘initial notice’ and ‘full plans’ have the meanings given in the Building Regulations 2010.

The changes focus on the following fire safety provisions:

a. Ban of combustible materials in and on the external walls of buildings:
   - Consequential amendments following the laying of the Building (Amendment) (England) Regulations 2022.
   - Updated provisions in Section 10 and 12 of Volume 1 and 2 respectively for residential buildings (purpose groups 1 and 2) with a storey 11m or more in height.

b. Secure information boxes:
   - A new recommendation for secure information boxes in blocks of flats with storeys over 11m.

c. Evacuation alert systems:
   - A new recommendation for evacuation alert systems in blocks of flats with storeys over 18m.

c. Clarifications and corrections:
   - Clarification of further diagrams, further text clarifications and corrections.

Full details of the changes are provided below.

The Building Regulations

Notification of work

Page iv  Replace sub-paragraph (b) with the following.

b. It is work exempted from the need to notify by regulation 12(6)(a) of, or Schedule 4 to, the Building Regulations.

Section 0: Approved Document B: Fire safety – dwellings

Page 5  In Table 0.1 Classification of purpose groups, replace the ‘Residential (institutional) 2(a)’ row with the following.

| Residential (institutional) 2(a) | Hospital, home, school or other similar establishment, where people sleep on the premises. The building may be either of the following:
|---------------------------------|--------------------------------------------------
|                                 | • Living accommodation for, or accommodation for the treatment, care or maintenance of, either:
|                                 |   – disabled people with a range of impairments including physical, sensory and cognitive impairments, or mental health conditions
|                                 |   – people under the age of 5 years.
|                                 | • A place of lawful detention. |
Section 1: Fire detection and alarm systems

Page 9  Replace paragraph 1.8 with the following.

1.8   A fire detection and alarm system should be installed where either of the following applies.
   a. A new habitable room is provided above or below the ground storey.
   b. A new habitable room is provided at the ground storey, without a final exit.

Replace paragraph 1.9 with the following.

1.9   Smoke alarms should be provided in the circulation spaces of the dwelling in accordance with paragraphs 1.1 to 1.4.

Section 2: Means of escape – dwellinghouses

Page 17  Replace Diagram 2.7 with the following.

See para 2.17

Diagram 2.7  Fire resistance of areas near to external stairs
Section 3: Means of escape – flats

Page 21  Replace paragraph 3.14 with the following.

3.14 The internal arrangement of single storey or multi-storey flats should comply with paragraphs 3.15 to 3.17. Alternatively, the guidance in paragraphs 3.18 to 3.22 may be followed.

Where a flat is accessed via the common parts of a block of flats it may be necessary to provide a protected entrance hall to meet the provisions of paragraph 3.28 and Diagram 3.9.

Page 22  Paragraph 3.18, replace sub-paragraph (c) with the following.

c. Provide an alternative exit from the flat complying with paragraph 3.19.

Replace Diagram 3.2 with the following.

Diagram 3.2  Flat where all habitable rooms have direct access to an entrance hall

NOTE: Bathrooms do not need to have fire doorsets provided that the bathroom is separated by fire resisting construction from the adjacent rooms.
Replace Diagram 3.3 with the following.

Diagram 3.3  Flat with restricted travel distance from furthest point to entrance

Page 23  Replace Diagram 3.4 with the following.

Diagram 3.4  Flat with an alternative exit, but where all habitable rooms have no direct access to an entrance hall

Paragraph 3.21, replace sub-paragraph (c) with the following.

c.  **Approach 3** — provide a protected stairway plus a sprinkler system in accordance with Appendix E (smoke alarms should also be provided in accordance with Section 1).
Page 24  Replace Diagram 3.5 with the following.

See para 3.21

a. Entrance level

b. Level(s) above or below entrance level

Diagram 3.5  Multi-storey flat with alternative exits from each habitable room, except at entrance level

Replace Diagram 3.6 with the following.

See para 3.21

a. Entrance level

b. Level(s) above or below entrance level

Diagram 3.6  Multi-storey flat with protected entrance hall and landing
Page 26  
**Replace** paragraph 3.25 with the following.

### 3.25
The following paragraphs deal with **means of escape** from the entrance doors of **flats** to a **final exit**. They do not apply to **flats** with a top **storey** that is a maximum of 4.5m above ground level (designed in accordance with paragraphs 3.15 to 3.17).

Reference should also be made to the following.

- Requirement B3 regarding **compartment walls** and **protected shafts**.
- Requirement B5 regarding access for the fire and rescue service.

Page 27  
**Replace** Diagram 3.7 with the following.

See para 3.27 and 3.36

**a. Corridor access flats**

**b. Lobby access flats**

**NOTES:**
1. The arrangements shown also apply to the top storey.
2. See Diagram 3.9 for small single stair buildings.
3. All doors shown are fire doorsets.
4. Where travel distance is measured to a stair lobby, the lobby must not provide direct access to any storage room, flat or other space containing a potential fire hazard.
5. For further guidance on the performance of the fire doorsets from the corridor to the flat and/or stairway refer to Appendix C, Table C1.
Replace Diagram 3.8 with the following.

See para 3.27 and 3.36

a. Corridor access without dead ends

b. Corridor access with dead ends

The central door may be omitted if maximum travel distance is not more than 15m

c. ‘T’ junction with main corridor

NOTES:
1. The arrangements shown also apply to the top storey.
2. For further guidance on the fire resistance rating of the fire doorsets from the corridor to the flat and/or stairway refer to Appendix C, Table C1.
Page 29  **Replace** Diagram 3.9 with the following.

![Diagram 3.9](diagram.png)

**NOTES:**
1. The arrangements shown also apply to the top storey.
2. If the travel distance across the lobby in diagram (a) exceeds 4.5m, Diagram 3.7 applies.
3. Where, in Diagram (b), the lobby between the common stair and the flat is omitted in small single stair buildings, an automatic opening vent with a geometric free area of at least 1m² is required at the top of the stair, which is operated on detection of smoke at any storey in the stair.
4. For further guidance on the fire rating of the fire doorsets from the corridor to the flat and/or stairway refer to Appendix C, Table C1.

Page 30  **Replace** paragraph 3.41 with the following.

3.41 Except for two storey blocks of flats, all escape routes should have adequate artificial lighting. If the mains electricity power supply fails, escape lighting should illuminate the route (including external escape routes).

Page 32  Paragraph 3.51, **replace** sub-paragraph (b)(iii) with the following.

iii. The smoke shaft should be constructed from a class A1 material. All vents should either be a smoke leakage (S) rated fire doorset (see Appendix C, Table C1, item 2.e for minimum fire resistance) or fitted with a smoke control damper achieving the same period of fire resistance and designed to operate as described below. The shaft should be vertical from base to head, with a maximum of 4m at a maximum inclined angle of 30 degrees.
Page 33  Replace paragraph 3.62 with the following.

3.62  Every common stair should be a protected stairway. Where the protected stairway passes from one compartment to another, it should be within a protected shaft.

Page 34  Paragraph 3.66, replace sub-paragraph (b) with the following.

b.  The stair meets the provisions in paragraph 3.68.

Page 35  Replace Diagram 3.11 with the following.

See para 3.68

Example a.

Example b.

Section A–A

Section B–B

NOTE: 6m maximum stair height without weather protection.

Diagram 3.11  Fire resistance of areas near to external stairs
**Section 4: Wall and ceiling linings**

Page 45  Replace Diagram 4.1 with the following.

See para 4.15

| a. Diffuser forming part of ceiling | b. Diffusers of light fittings attached to the soffit of a ceiling or suspended beneath a ceiling |

![Diagram 4.1](Image)

Diagram 4.1  Lighting diffuser in relation to ceiling

**Section 5: Internal fire spread – dwellinghouses**

Page 50  Replace paragraph 5.1 with the following.

5.1  **Elements of structure** such as structural frames, beams, columns, loadbearing walls (internal and external), floor structures and **gallery** structures should have, as a minimum, the **fire resistance** given in Appendix B, Table B3.

**Section 6: Loadbearing elements of structures – flats**

Page 57  Replace the section title with the following.

Replace paragraph 6.1 with the following.

6.1  **Elements of structure** such as structural frames, beams, columns, loadbearing walls (internal and external), floor structures and **gallery** structures should have, as a minimum, the **fire resistance** given in Appendix B, Table B3.

**NOTE:** If one **element of structure** supports or stabilises another, as a minimum the supporting element should have the same **fire resistance** as the other element.
Section 7: Compartmentation/sprinklers – flats

Page 59  Replace paragraph 7.1 with the following.

7.1 All of the following should be provided as compartment walls and compartment floors and should have, as a minimum, the fire resistance given in Appendix B, Table B3.

a. Any floor (unless it is within a flat, i.e. between one storey and another within one individual dwelling).

b. Any wall separating a flat from another part of the building.

c. Any wall enclosing a refuse storage chamber.

d. Any wall common to two or more buildings.

Page 62  Replace Diagram 7.1 with the following.

Diagram 7.1  Construction of protected shafts

This diagram shows three common examples which illustrate the principles of the construction of protected shafts. The elements enclosing the shaft (unless formed by adjacent external walls) are compartment walls and floors.

Protected shaft A is bounded on three sides by compartment walls and on the fourth side by an external wall.

Protected shaft B is bounded on four sides by compartment walls.

Protected shaft C is a services duct bounded on four sides by compartment walls.

The shaft structure (including any openings) should meet the relevant provisions for both of the following: compartment walls (see paragraphs 7.5 to 7.20) and external walls (see Sections 10 and 11 and Diagram 3.10).
Amendments to the Approved Documents

The Building Regulations 2010

Page 63  Replace Diagram 7.2 with the following.

Diagram 7.2  Uninsulated glazed screen separating protected shaft from lobby or corridor

Section 8: Cavities – flats

Page 65  Replace subheading before paragraph 8.3 with the following.

Junctions and edges of cavities

Page 67  Replace Diagram 8.3 with the following.

Diagram 8.3  Fire resisting ceiling below cavity

Page 68  Replace paragraph 8.9 with the following.

8.9  Cavity barriers should meet the requirements set out in paragraphs 5.21 to 5.24.
Section 9: Protection of openings and fire-stopping

Page 69  Replace paragraph 9.1 with the following.

9.1 Every joint, imperfect fit and opening for services through a fire-separating element should be sealed with fire-stopping to ensure that the fire resistance of the element is not impaired. Fire-stopping delays the spread of fire and, generally, the spread of smoke as well.

Page 70  Replace Diagram 9.2 with the following.

Diagram 9.2 Pipes penetrating fire-separating elements

NOTES:
1. Make the opening in the structure as small as possible and provide fire-stopping between pipe and structure.
2. See Table 9.1 for materials specification.
3. The sleeve should be class A1 rated.

Page 71  In Table 9.1 Maximum nominal internal diameter of pipes passing through a compartment wall/floor, replace the table title with the following.

Table 9.1 Maximum nominal internal diameter of pipes passing through a fire-separating element

Page 72  Replace paragraph 9.12 with the following.

9.12 If air handling ducts pass through fire-separating elements, the fire performance of the elements should be maintained using one or more of the following four methods. In most ductwork systems, a combination of the four methods is best.

a. Method 1 – thermally activated fire dampers.
b. Method 2 – fire resisting enclosures.
d. Method 4 – automatically activated fire and smoke dampers triggered by smoke detectors.
Amendments to the Approved Documents

The Building Regulations 2010

Requirement B4: External fire spread

Page 76  Replace the requirement text with the following.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Limits on application</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>External fire spread</strong></td>
<td></td>
</tr>
<tr>
<td>B4. (1) The external walls of the building shall adequately resist the spread of fire over the walls and from one building to another having regard to the height, use and position of the building.</td>
<td></td>
</tr>
<tr>
<td>(2) The roof of the building shall adequately resist the spread of fire over the roof and from one building to another, having regard to the use and position of the building.</td>
<td></td>
</tr>
</tbody>
</table>

**Regulation**

**Regulation 7 – Materials and workmanship**

(1) Building work shall be carried out—

(a) with adequate and proper materials which—

(i) are appropriate for the circumstances in which they are used,

(ii) are adequately mixed or prepared, and

(iii) are applied, used or fixed so as adequately to perform the functions for which they are designed; and

(b) in a workmanlike manner.

(1A) Building work shall be carried out so that relevant metal composite material does not become part of an external wall, or specified attachment, of any building.

(2) Subject to paragraph (3), building work shall be carried out so that materials which become part of an external wall, or specified attachment, of a relevant building are of European Classification A2-s1, d0 or A1 (classified in accordance with the reaction to fire classification).
Regulation continued

(3) Paragraph (2) does not apply to—

(a) cavity trays when used between two leaves of masonry;
(b) any part of a roof (other than any part of a roof which falls within paragraph (iv) of regulation 2(6)) if that part is connected to an external wall;
(c) door frames and doors;
(d) electrical installations;
(da) fibre optic cables;
(e) insulation and water proofing materials used below ground level or up to 300mm above that level;
(f) intumescent and fire stopping materials where the inclusion of the materials is necessary to meet the requirements of Part B of Schedule 1;
(g) membranes;
(h) seals, gaskets, fixings, sealants and backer rods;
(ha) components associated with a solar shading device, excluding components whose primary function is to provide shade or deflect sunlight, such as the awning, curtain or slats;
(i) thermal break materials where the inclusion of the materials is necessary to meet the thermal bridging requirements of Part L of Schedule 1;
(j) window frames and glass; or
(k) materials which form the top horizontal floor layer of a balcony which are of European Classification A1fl or A2fl-sl (classified in accordance with the reaction to fire classification) provided that the entire layer has an imperforate substrate under it.

(4) In this regulation—

(a) a “relevant building” means a building with a storey (not including roof-top plant areas or any storey consisting exclusively of plant rooms) at least 18 metres above ground level and which—
   (i) contains one or more dwellings;
   (ii) contains an institution; or
   (iii) contains a room for residential purposes; and
(b) “above ground level” in relation to a storey means above ground level when measured from the lowest ground level adjoining the outside of a building to the top of the floor surface of the storey.
Section 10: Resisting fire spread over external walls

Introduction

10.1 The external wall of a building should not provide a medium for fire spread if that is likely to be a risk to health and safety. Combustible materials and cavities in external walls and attachments to them can present such a risk, particularly in tall buildings. The guidance in this section is designed to reduce the risk of fire spread as well as the risk of ignition from flames coming from adjacent buildings.

Fire resistance

10.2 This section provides guidance on resisting fire spread over external walls; however, it does not deal with fire resistance of external walls. An external wall may need fire resistance to meet the provisions of Section 3 (Means of escape – flats), Section 6 (Loadbearing elements of structure – flats), Section 11 (Resisting fire spread from one building to another) or Section 15 (Access to buildings for firefighting personnel – flats).

Combustibility of external walls

10.3 The external walls of buildings other than those described in regulation 7(4) of the Building Regulations should achieve either of the following.

a. Follow the provisions given in paragraphs 10.5 to 10.9, which provide guidance on all of the following.
   i. External surfaces.
   ii. Materials and products.
   iii. Cavities and cavity barriers.

b. Meet the performance criteria given in BRE report BR 135 for external walls using full-scale test data from BS 8414-1 or BS 8414-2.

10.4 In relation to buildings of any height or use, consideration should be given to the choice of materials (including their extent and arrangement) used for the external wall, or attachments to the wall (e.g. balconies, etc.), to reduce the risk of fire spread over the wall.
### External surfaces

10.5 The external surfaces (i.e. outermost external material) of external walls should comply with the provisions in Table 10.1. The provisions in Table 10.1 apply to each wall individually in relation to its proximity to the relevant boundary.

#### Table 10.1 Reaction to fire performance of external surface of walls

<table>
<thead>
<tr>
<th>Building type</th>
<th>Building height</th>
<th>Less than 1000mm from the relevant boundary</th>
<th>1000mm or more from the relevant boundary</th>
</tr>
</thead>

<td>Class B-s3, d2(2) or better</td>
<td>From 18m in height and above: class B-s3, d2(3) or better</td>
</tr>
</tbody>
</table>

**NOTES:**

In all cases all the following provisions apply.

- Regulation 7(1A) prohibits the use of relevant metal composite materials in the external walls of all buildings of any height (see paragraphs 10.11 and 10.12).
- The advice in paragraph 10.4 should always be followed.

In addition to the provisions within this table, buildings with a storey 18m or more above ground level should also meet the provisions of paragraph 10.6.

In addition to the provisions within this table, buildings with a storey 11m or more above ground level should also meet the provisions of paragraph 10.7.

1. The restrictions for these buildings apply to all the materials used in the external wall and specified attachments (see paragraphs 10.13 to 10.16 for further guidance).
2. Profiled or flat steel sheet at least 0.5mm thick with an organic coating of no more than 0.2mm thickness is also acceptable.
3. Timber cladding at least 9mm thick is also acceptable.
4. 10m is measured from the top surface of the roof.
Materials and products

10.6 In a building with a storey 18m or more in height (see Diagram D6 in Appendix D) any insulation product, filler material (such as the core materials of metal composite panels, sandwich panels and window spandrel panels but not including gaskets, sealants and similar) etc. used in the construction of an external wall should be class A2-s3, d2 or better (see Appendix B). This restriction does not apply to masonry cavity wall construction which complies with Diagram 8.2 in Section 8. Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

10.7 In buildings that include a ‘residential’ purpose (purpose groups 1 and 2) with a storey 11m or more in height (see Diagram D6 in Appendix D) any insulation product, filler material (such as the core materials of metal composite panels, sandwich panels and window spandrel panels but not including gaskets, sealants and similar) etc. used in the construction of an external wall should be class A2-s1, d0 or better (see Appendix B). This restriction does not apply to masonry cavity wall construction which complies with Diagram 8.2 in Section 8. Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

10.8 Best practice guidance for green walls (also called living walls) can be found in Fire Performance of Green Roofs and Walls, published by the Department for Communities and Local Government. Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

Cavities and cavity barriers

10.9 Cavity barriers should be provided in accordance with Section 5 in dwellinghouses and Section 8 in flats.

Balconies

10.10 In buildings that include a ‘residential’ purpose (purpose groups 1 and 2) with a storey 11m or more in height (see Diagram D6 in Appendix D) balconies should meet either of the following conditions.

a. Only contain materials achieving class A1 or A2-s1, d0, except for any of the following.
   i. Cavity trays when used between two leaves of masonry.
   ii. Intumescent and fire-stopping materials where the inclusion of the materials is necessary to meet the requirements of Part B of Schedule 1 to the Building Regulations 2010.
   iii. Membranes.
   iv. Seals, gaskets, fixings, sealants and backer rods.
   v. Thermal break materials where the inclusion of the materials is necessary to meet the thermal bridging requirements of Part L of Schedule 1 to the Building Regulations 2010.
   vi. Any material achieving class A1fl or A2fl-s1 when it forms the top horizontal floor layer of a balcony and is provided with an imperforate substrate under it which extends to the full size of the class A1fl or A2fl-s1 material.
   vii. Electrical installations.
   viii. Fibre optic cables.
b. Achieve both of the following conditions.

i. Have an imperforate soffit which extends to the full area of the balcony, achieves a minimum REI 30 rating and is constructed of materials achieving class A2-s1, d0 or better.

ii. Materials achieving class B-s1, d0 or worse extending beyond the boundary of a single compartment should include a band of material rated class A2-s1, d0 or better, a minimum of 300mm in width centred on that boundary line.

Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

**Metal composite materials**

10.11 Regulation 7(1A) prohibits the use of relevant metal composite materials in the external walls of all buildings of any height.

10.12 Relevant metal composite materials are defined (in regulation 2(6)(c)) as any panel or sheet, having a thickness of no more than 10mm which is composed of a number of layers two or more of which are made of metal, alloy or metal compound and one or more of which is a substantial layer made of a material having a gross calorific value of more than 35MJ/kg when tested in accordance with BS EN ISO 1716. A substantial layer is defined as a layer which is at least 1mm thick or has a mass per unit area of at least 1kg/m².

**Regulation 7(2) and requirement B4**

**Materials**

10.13 Regulation 7(1)(a) requires that materials used in building work are appropriate for the circumstances in which they are used. Regulation 7(2) sets requirements in respect of external walls and specified attachments in relevant buildings.

**NOTE:** Further guidance on regulation 7(1) can be found in HM Government’s Manual to the Building Regulations.

10.14 Regulation 7(2) applies to any building with a storey at least 18m above ground level (as measured in accordance with Diagram D6 in Appendix D) and which contains one or more dwellings; an institution; or a room for residential purposes. It requires that all materials which become part of an external wall or specified attachment achieve class A2-s1, d0 or class A1 in accordance with BS EN 13501-1, other than those exempted by regulation 7(3).

**NOTE:** The above includes student accommodation, care homes, sheltered housing, hospitals, dormitories in boarding schools, hotels, hostels and boarding houses. See regulation 7(4) for the definition of relevant buildings.

**NOTE:** Transposition to national class (Table B1) does not apply to the classification in this paragraph.

10.15 External walls and specified attachments are defined in regulation 2(6) and these definitions include any parts of the external wall as well as balconies, solar panels and solar shading.

10.16 Regulation 7(3) provides an exemption for certain components found in external walls and specified attachments.
Material change of use

10.17 Regulations 5(k) and 6(3) provide that, where the use of a building is changed such that the building becomes a building described in regulation 7(4), the construction of the external walls, and specified attachments, must be investigated and, where necessary, work must be carried out to ensure they only contain materials achieving class A2-s1, d0 or class A1, other than those exempted by regulation 7(3).

Solar shading devices

10.18 Regulation 7(2) requires that the curtain and or slats of solar shading devices in a relevant building (as defined in regulation 7(4)) achieve class A1 or A2-s1, d0. The curtain of solar shading devices cannot be classified as a membrane in accordance with regulation 7(3).

10.19 Solar shading devices installed up to 4.5m above ground level are not required to meet the requirements of regulation 7(2).

Additional considerations

10.20 The provisions of regulation 7 apply in addition to requirement B4. Therefore, for buildings described in regulation 7(4), the potential impact of any products incorporated into or onto the external walls and specified attachments should be carefully considered with regard to their number, size, orientation and position.

10.21 Particular attention is drawn to the following points.

a. Membranes used as part of the external wall construction above ground level should achieve a minimum of class B-s3, d0. Roofing membranes do not need to achieve a minimum of class A2-s1, d0 when used as part of a roof connecting to an external wall.

b. Internal linings should comply with the guidance provided in Section 4.

c. Any part of a roof should achieve the minimum performance as detailed in Section 12.

d. As per regulation 7(3), window frames and glass (including laminated glass) are exempted from regulation 7(2). Window spandrel panels and infill panels must comply with regulation 7(2).

e. Thermal breaks are small elements used as part of the external wall construction to restrict thermal bridging. There is no minimum performance for these materials. However, they should not span two compartments and should be limited in size to the minimum required to restrict the thermal bridging (the principal insulation layer is not to be regarded as a thermal break).

f. Regulation 7(2) only applies to specified attachments. Shop front signs and similar attachments are not covered by the requirements of regulation 7(2), although attention is drawn to paragraph 10.21g.

g. While regulation 7(2) applies to materials which become part of an external wall or specified attachment, consideration should be given to other attachments to the wall which could impact on the risk of fire spread over the wall.

h. Any material achieving class A1fl or A2fl-s1 in accordance with BS EN 13501-1 is exempted when it meets both of the following conditions.

i. It forms the top horizontal floor layer of a balcony.

ii. It is provided with an imperforate substrate under it which extends to the full size of the class A1fl or A2fl-s1 material.
Section 11: Resisting fire spread from one building to another

Page 86  Replace paragraph 11.7 with the following.

11.7 Where a fire resisting external wall has an external surface material that is worse than class B-s3, d2 and is more than 1mm thick, that part of the wall should be classified as an unprotected area equating to half its area (Diagram 11.4).

Replace paragraph 11.10 with the following.

11.10 Exclude external walls of stairways in a protected shaft when assessing unprotected areas (see Diagram 11.5).

Page 89  Replace paragraph 11.16 with the following.

11.16 Two simple methods are given for calculating the acceptable amount of unprotected area in an external wall that is a minimum of 1000mm from any point on the relevant boundary. More precise methods are described in BRE report BR 187 and may be used instead. When using BR 187 the following radiation intensity at each unprotected area should be assumed.

- a. 84kw/m$^2$ if the purpose group of the building is ‘residential’ (purpose groups 1 or 2), ‘office’ (purpose group 3) or ‘assembly and recreation’ (purpose group 5) or if the building is an open-sided multi-storey car park (purpose group 7(b)).
- b. 168kw/m$^2$ if the purpose group of the building is ‘shop and commercial’ (purpose group 4), ‘industrial’ (purpose group 6) or ‘storage and other non-residential’ (purpose group 7(a)).

Section 12: Resisting fire spread over roof coverings

Page 93 In Table 12.1 Limitations on roof coverings, replace note 3 with the following.

3. Acceptable on buildings not listed in (2) if both of the following apply.

- a. Part of the roof has a maximum area of 3m$^2$ and is a minimum of 1500mm from any similar part.
- b. The roof between the parts is covered with a material rated class A2-s3, d2 or better.
Requirement B5: Access and facilities for the fire service

Intention

Page 96 Insert new sub-paragraph (e).
   e. A facility to store building information for firefighters to complete their tasks.

Section 13: Vehicle access

Page 97 Replace paragraph 13.1 with the following.

13.1 For dwellinghouses, access for a pumping appliance should be provided to within 45m of all points inside the dwellinghouse.

Every elevation to which vehicle access is provided should have a suitable door(s), not less than 750mm wide, giving access to the interior of the building.

Replace paragraph 13.2 with the following.

13.2 For flats, either of the following provisions should be made.
   a. Provide access for a pumping appliance to within 45m of all points inside each flat of a block, measured along the route of the hose. Every elevation to which vehicle access is provided should have a suitable door(s), not less than 750mm wide, giving access to the interior of the building. Door(s) should be provided such that there is no more than 60m between each door and/or the end of that elevation (e.g. a 150m elevation would need at least two doors).
   b. Provide fire mains in accordance with paragraphs 13.5 and 13.6.

Page 98 Paragraph 13.5, replace sub-paragraph (b) with the following.
   b. The fire main inlet connection point should be visible from the parking position of the appliance, and meet the provisions in Section 8 of BS 9990.
Section 15: Access to buildings for firefighting personnel – flats

Page 104  Replace paragraph 15.5 with the following.

15.5 In buildings where a firefighting shaft is required, a minimum of two firefighting shafts should be provided in either of the following situations.

a. A building that has both of the following.
   i. A storey with a floor area of 900m² or more.
   ii. A storey 18m or more above the fire and rescue service vehicle access level.

b. A building with a basement storey which is more than 900m².

Page 106  Insert new headings and paragraphs after paragraph 15.16 as follows.

Evacuation alert systems

15.17 In blocks of flats (purpose group 1(a)) with a top storey over 18m above ground level (see Diagram D6 in Appendix D) an evacuation alert system should be provided in accordance with BS 8629.

Secure information boxes

15.18 A secure information box provides a secure facility to store information about a building for use by the fire service during an incident.

15.19 Blocks of flats (purpose group 1(a)) with a top storey more than 11m above ground level (see Diagram D6 in Appendix D) should be provided with a secure information box.

 NOTE: Consideration should also be given to other buildings with large, complex or uncommon layouts where the provision of a secure information box may be beneficial.

15.20 The box should meet all of the following conditions.

a. Sized to accommodate all necessary information.

b. Easily located and identified by firefighters.

c. Secured to resist unauthorised access but readily accessible by firefighters.

d. Protected from the weather.

15.21 Best practice guidance can be found in Sections 2 to 4 of the Code of Practice for the Provision of Premises Information Boxes in Residential Buildings published by the Fire Industry Association (FIA).
Section 16: Venting of heat and smoke from basements – flats

Page 108 Replace Diagram 16.1 with the following.

See paras 16.1 and 16.13

Diagram 16.1 Fire resisting construction for smoke outlet shafts

Appendix A: Key terms

Page 115 Insert the following entry between the definitions of Corridor access and Dead end.

Curtain Part of a solar shading device which is set in motion by the operating system and fulfils the purpose of a blind, awning or shutter.

Page 118 Insert the following entry between the definitions of Site and Specified attachment.

Solar shading device A device attached to an external wall for reducing heat gain or controlling visible light within a building by shading or deflecting sunlight.
## Appendix B: Performance of materials, products and structures

### Pages 120
Replace paragraph B4 with the following.

**B4** Where it is proposed to assess the classification of a product or system in lieu of carrying out a specific test (as in paragraph B1c), this should be done in accordance with the relevant standard for extended application for the test in question and should include details of the test evidence that has been used to support the assessment.

For performance classifications where there is no specific standard for extended application, assessment reports should be produced in accordance with the principles of BS EN 15725 and should include details of the test evidence that has been used to support the assessment. Further information on best practice is provided in the Passive Fire Protection Forum’s Guide to Undertaking Technical Assessments of the Fire Performance of Construction Products Based on Fire Test Evidence.

**NOTE:** Regulation 7(2) limits components used in or on the external walls of certain buildings to materials achieving class A2-s1, d0 or class A1 (see Section 10). Assessments cannot be used to demonstrate compliance with this requirement.

### Pages 125 to 128
Replace paragraph B25 with the following.

**B25** This document uses the European classification system for fire resistance set out in BS EN 13501-2 to 4; however, there may be some products lawfully on the market using the classification system set out in previous editions. In those situations the alternative classifications given in Table B3 can be used.

In Table B3 Specific provisions of the test for fire resistance of elements of structure, etc., replace rows as follows.

1. **Replace** row 2 with the following.

<table>
<thead>
<tr>
<th>2. Loadbearing wall (for a wall which is also described in any of the following items, the more onerous guidance should be applied)</th>
<th>R see Table B4</th>
<th>See Table B4</th>
<th>Not applicable</th>
<th>Not applicable</th>
<th>Each side separately</th>
</tr>
</thead>
<tbody>
<tr>
<td>b. in upper storey of two storey dwellinghouse (but not over garage or basement)</td>
<td>R 30 and EI 15</td>
<td>30 min</td>
<td>15 min</td>
<td>15 min</td>
<td>From underside(©)</td>
</tr>
</tbody>
</table>
3. **Replace** row 5b with the following.

<table>
<thead>
<tr>
<th>b. any part a minimum of 1000mm from the relevant boundary (6)</th>
<th>RE see Table B4 and I 15</th>
<th>See Table B4</th>
<th>See Table B4</th>
<th>15 min</th>
<th>From inside the building</th>
</tr>
</thead>
</table>

4. **Replace** row 8 with the following.

<table>
<thead>
<tr>
<th>8. <strong>Protected shafts</strong> Excluding any firefighting shaft: a. any glazing described in Section 7 diagram 7.2</th>
<th>E 30</th>
<th>Not applicable</th>
<th>30 min</th>
<th>No provision (8)</th>
<th>Each side separately</th>
</tr>
</thead>
<tbody>
<tr>
<td>b. any other part between the shaft and a protected lobby/corridor described in Section 7 diagram 7.2</td>
<td>REI 30</td>
<td>30 min</td>
<td>30 min</td>
<td>30 min</td>
<td>Each side separately</td>
</tr>
<tr>
<td>c. any part not described in (a) or (b) above.</td>
<td>REI see Table B4</td>
<td>See Table B4</td>
<td>See Table B4</td>
<td>See Table B4</td>
<td>Each side separately</td>
</tr>
</tbody>
</table>

5. **Replace** row 17 with the following.

<table>
<thead>
<tr>
<th>17. <strong>Cavity barrier</strong></th>
<th>E 30 and I 15</th>
<th>Not applicable</th>
<th>30 min</th>
<th>15 min</th>
<th>Each side separately</th>
</tr>
</thead>
</table>

**Appendix D: Methods of measurement**

**Page 141** *Replace* Diagram D1 with the following.

**Diagram D1** Measurement of door width
The Building Regulations 2010

Approved Document B: Fire safety
Volume 2 – Buildings other than dwellings
2019 edition incorporating the 2020 amendments

List of amendments
June 2022

The Building Regulations

Notification of work

Page iv  Replace sub-paragraph (b) with the following.

b. It is work exempted from the need to notify by regulation 12(6)(a) of, or Schedule 4 to, the Building Regulations.

Section 0: Approved Document B: Fire safety – buildings other than dwellings

Page 5  In Table 0.1 Classification of purpose groups, replace the ‘Residential (institutional) 2(a)’ row with the following.

<table>
<thead>
<tr>
<th>Residential (institutional) 2(a)</th>
<th>Hospital, home, school or other similar establishment, where people sleep on the premises. The building may be either of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Living accommodation for, or accommodation for the treatment, care or maintenance of, either:</td>
</tr>
<tr>
<td></td>
<td>– disabled people with a range of impairments including physical, sensory and cognitive impairments, or mental health conditions</td>
</tr>
<tr>
<td></td>
<td>– people under the age of 5 years.</td>
</tr>
<tr>
<td></td>
<td>• A place of lawful detention.</td>
</tr>
</tbody>
</table>
Section 1: Fire detection and alarm systems

Page 11 Insert new heading and paragraph after paragraph 1.17 as follows.

Student accommodation

1.18 In student residences that are designed and occupied as a block of flats, separate automatic detection should be provided in each self-contained flat where all of the following apply.

a. A group of up to six students shares the flat.

b. Each flat has its own entrance door.

c. The compartmentation principles for flats in Section 7 of Approved Document B Volume 1 have been followed.

Where a total evacuation strategy is adopted, the alarm system should follow the guidance elsewhere in this section.

Section 2: Design for horizontal escape

Page 17 Replace Diagram 2.4 with the following.

![Diagram 2.4 Exits in a central core](image)

NOTE: The doors at both ends of the area marked 'S' should be self-closing fire doorsets unless the area is sub-divided such that any fire in that area will not be able to prejudice both sections of corridor at the same time. If that area is a lift lobby, doors should be provided as shown in Figure 9 in BS 9999.

L Lift
S Services, toilets, etc.
Fd Self-closing E 20 S fire doorsets
Fda Possible alternative position for fire doorset
C Corridor off which accommodation opens
PS Protected stairway
A Accommodation (e.g. office space – indicative layout shown)
Page 20  Replace Diagram 2.6 with the following.

See para 2.23

Diagram 2.6  Merging flows at final exit

- D: Minimum 2m, where ‘N’ is greater than 60 people
- N: Number of people served by ground floor storey exit
- W: Width of final exit in metres
- S: Stair width in metres
Replace Diagram 2.10 with the following.

See para 2.28

a. ‘T’ junction with main corridor

b. Continuation past stairway

Fd Self-closing fire doorsets

Protected corridor

Diagram 2.10 Dead-end corridors exceeding 4.5m long
Replace Diagram 2.11 with the following.

See para 2.38

Diagram 2.11  Progressive horizontal evacuation in care homes

- Escape route to adjacent compartment, storey exit or final exit
- Compartment wall
- Fire doorset in compartment wall

NOTE: Bedrooms and all ancillary accommodation should be enclosed in fire resisting construction.
Section 3: Design for vertical escape

Page 30  Replace Diagram 3.1 with the following.

See para 3.5

Diagram 3.1  Refuge formed by compartmentation

Page 35  Replace paragraph 3.20 with the following.

3.20  Phased evacuation in buildings with a storey over 30m in height introduces the potential for escaping people to impede firefighters entering and operating within the building. This can be addressed by consulting with the fire and rescue service about special management procedures.

In very tall buildings, typically with a storey over 45m in height, physical measures may need to be incorporated, such as by discounting a stair.

Paragraph 3.21, replace sub-paragraph (d) with the following.

d.  If there is a storey over 30m above ground level, the building should be protected throughout by an automatic sprinkler system in accordance with Appendix E.

Page 36  Replace paragraph 3.23 with the following.

3.23  Every internal escape stair should be a protected stairway (within a fire resisting enclosure). If it is also a protected shaft (i.e. it passes from one compartment to another) or firefighting shaft, additional guidance in Sections 8 and 17 applies.

There is one exception: an unprotected stair (e.g. an accommodation stair) may form part of an internal route to a storey exit or final exit, provided that the distance of travel and the number of people involved are very limited. For example, small premises (Section 4) and raised storage areas (see paragraphs 7.6 and 7.7).
Page 39  Replace Diagram 3.4 with the following.

See para 3.32

Example a.

Example b.

NOTE:
6m maximum stair height without weather protection.

Diagram 3.4  Fire resistance of areas near to external stairs
The Building Regulations 2010

**Section 5: General provisions**

Page 50  In Table 5.1 **Provisions for escape lighting**, replace the 'Residential' row with the following.

| Residential | All common escape routes\(^0\), except in two storey blocks of flats |

**Section 6: Wall and ceiling linings**

Page 57  Replace Diagram 6.1 with the following.

Diagram 6.1  Lighting diffuser in relation to ceiling

**Section 7: Loadbearing elements of structures**

Page 63  Replace the section title with the following.

**Section 7: Loadbearing elements of structure**

Replace paragraph 7.1 with the following.

7.1  **Elements of structure** such as structural frames, beams, columns, loadbearing walls (internal and external), floor structures and **gallery** structures should have, as a minimum, the **fire resistance** given in Appendix B, Table B3.

**Section 8: Compartmentation/sprinklers**

Page 67  Replace Diagram 8.1 with the following.
The Building Regulations 2010

See para 8.11

a. Example of compartmentation in an unsprinklered assembly and recreation, shop, or commercial building see paragraph 8.11a

None of the floors in this case would need to be compartment floors, but the two storeys exceeding 2000m² would need to be divided into compartments not more than 2000m² by compartment walls.

The compartment walls in example (a) do not need to be in one vertical plane.

b. Compartmentation in buildings over 30m see paragraph 8.11b

In a building with a top storey over 30m in height all storeys should be separated by compartment floors. For advice on the special conditions in atrium buildings see Annex B of BS 9999.

c. Shallow basement see paragraph 8.11c

Only the floor of the ground storey need be a compartment floor if the lower basement is at a depth of not more than 10m.

d. Deep basement see paragraph 8.11d

All basement storeys to be separated by compartment floors if any storey is at a depth of more than 10m.

Diagram 8.1 Compartment floors: illustration of guidance in paragraph 8.11
Replace Diagram 8.3 with the following.

Diagram 8.3 Construction of protected shafts

Replace Diagram 8.4 with the following.

Diagram 8.4 Uninsulated glazed screen separating protected shaft from lobby or corridor
Section 9: Cavities

Page 77 Replace subheading before paragraph 9.3 with the following.

Junctions and edges of cavities

Page 78 Replace Diagram 9.3 with the following.

See para 9.5

Diagram 9.3 Fire resisting ceiling below cavity

Page 80 Replace the first sentence of paragraph 9.12 with the following.

If the undivided area exceeds 40m in any direction, there is no limit to its size if all of the following conditions are met.

Section 10: Protection of openings and fire-stopping

Page 82 Replace paragraph 10.1 with the following.

10.1 Every joint, imperfect fit and opening for services through a fire-separating element should be sealed with fire-stopping to ensure the fire resistance of the element is not impaired. Fire-stopping delays the spread of fire and, generally, the spread of smoke as well.
Replace Diagram 10.1 with the following.

See para 10.5

NOTES:
1. Make the opening in the structure as small as possible and provide fire-stopping between pipe and structure.
2. See Table 10.1 for materials specification.
3. The sleeve should be class A1 rated.

Diagram 10.1 Pipes penetrating fire-separating elements

In Table 10.1 Maximum nominal internal diameter of pipes passing through a compartment wall/floor, replace the table title with the following.

Table 10.1 Maximum nominal internal diameter of pipes passing through a fire-separating element

Replace paragraph 10.12 with the following.

10.12 If air handling ducts pass through fire-separating elements, the fire performance of the elements should be maintained using one or more of the following four methods. In most ductwork systems, a combination of the four methods is best.

a. Method 1 – thermally activated fire dampers.
b. Method 2 – fire resisting enclosures.
d. Method 4 – automatically activated fire and smoke dampers triggered by smoke detectors.
Section 11: Special provisions for car parks

Paragraph 11.2, replace sub-paragraph (b) with the following.

b. Each storey is naturally ventilated by permanent openings at each car parking level. The aggregate vent area is a minimum of 1/20 of that level’s floor area, at least half of which is provided equally by two opposite walls (1/80 on each side). The remaining free area can be distributed wherever possible.

Requirement B4: External fire spread

Replace the requirement text with the following.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Limits on application</th>
</tr>
</thead>
<tbody>
<tr>
<td>External fire spread</td>
<td></td>
</tr>
<tr>
<td>B4. (1)</td>
<td>The external walls of the building shall adequately resist the spread of fire over the walls and from one building to another having regard to the height, use and position of the building.</td>
</tr>
<tr>
<td>(2)</td>
<td>The roof of the building shall adequately resist the spread of fire over the roof and from one building to another, having regard to the use and position of the building.</td>
</tr>
</tbody>
</table>

Regulation

Regulation 7 – Materials and workmanship

(1) Building work shall be carried out—

(a) with adequate and proper materials which—

(i) are appropriate for the circumstances in which they are used,

(ii) are adequately mixed or prepared, and

(iii) are applied, used or fixed so as adequately to perform the functions for which they are designed; and

(b) in a workmanlike manner.

(1A) Building work shall be carried out so that relevant metal composite material does not become part of an external wall, or specified attachment, of any building.
(2) Subject to paragraph (3), building work shall be carried out so that materials which become part of an external wall, or specified attachment, of a relevant building are of European Classification A2-s1, d0 or A1 (classified in accordance with the reaction to fire classification).

(3) Paragraph (2) does not apply to—

(a) cavity trays when used between two leaves of masonry;
(b) any part of a roof (other than any part of a roof which falls within paragraph (iv) of regulation 2(6)) if that part is connected to an external wall;
(c) door frames and doors;
(d) electrical installations;
(da) fibre optic cables;
(e) insulation and water proofing materials used below ground level or up to 300mm above that level;
(f) intumescent and fire stopping materials where the inclusion of the materials is necessary to meet the requirements of Part B of Schedule 1;
(g) membranes;
(h) seals, gaskets, fixings, sealants and backer rods;
(ha) components associated with a solar shading device, excluding components whose primary function is to provide shade or deflect sunlight, such as the awning, curtain or slats;
(i) thermal break materials where the inclusion of the materials is necessary to meet the thermal bridging requirements of Part L of Schedule 1;
(j) window frames and glass; or
(k) materials which form the top horizontal floor layer of a balcony which are of European Classification A1fl or A2fl-sl (classified in accordance with the reaction to fire classification) provided that the entire layer has an imperforate substrate under it.

(4) In this regulation—

(a) a “relevant building” means a building with a storey (not including roof-top plant areas or any storey consisting exclusively of plant rooms) at least 18 metres above ground level and which—
(i) contains one or more dwellings;
(ii) contains an institution; or
(iii) contains a room for residential purposes; and
(b) “above ground level” in relation to a storey means above ground level when measured from the lowest ground level adjoining the outside of a building to the top of the floor surface of the storey.
Introduction

12.1 The external wall of a building should not provide a medium for fire spread if that is likely to be a risk to health and safety. Combustible materials and cavities in external walls and attachments to them can present such a risk, particularly in tall buildings. The guidance in this section is designed to reduce the risk of fire spread as well as the risk of ignition from flames coming from adjacent buildings.

Fire resistance

12.2 This section provides guidance on resisting fire spread over external walls; however, it does not deal with fire resistance of external walls. An external wall may need fire resistance to meet the provisions of Section 3 (Design for vertical escape), Section 7 (Loadbearing elements of structure), Section 13 (Resisting fire spread from one building to another) or Section 17 (Access to buildings for firefighting personnel).

Combustibility of external walls

12.3 The external walls of buildings other than those described in regulation 7(4) of the Building Regulations should achieve either of the following.

a. Follow the provisions given in paragraphs 12.5 to 12.10, which provide guidance on all of the following.
   i. External surfaces.
   ii. Materials and products.
   iii. Cavities and cavity barriers.

b. Meet the performance criteria given in BRE report BR 135 for external walls using full-scale test data from BS 8414-1 or BS 8414-2.

12.4 In relation to buildings of any height or use, consideration should be given to the choice of materials (including their extent and arrangement) used for the external wall, or attachments to the wall (e.g. balconies, etc.), to reduce the risk of fire spread over the wall.
### External surfaces

12.5 The external surfaces (i.e. outermost external material) of external walls should comply with the provisions in Table 12.1. The provisions in Table 12.1 apply to each wall individually in relation to its proximity to the relevant boundary.

<table>
<thead>
<tr>
<th>Building type</th>

<td>No provisions</td>
</tr>
</tbody>
</table>

**NOTES:**

In all cases all the following provisions apply.

- Regulation 7(1A) prohibits the use of relevant metal composite materials in the external walls of all buildings of any height (see paragraphs 12.12 and 12.13).

- The advice in paragraph 12.4 should always be followed.

In addition to the provisions within this table, buildings with a storey 18m or more above ground level should also meet the provisions of paragraph 12.6.

In addition to the provisions within this table, buildings with a storey 11m or more above ground level should also meet the provisions of paragraph 12.7.

1. The restrictions for these buildings apply to all the materials used in the external wall and specified attachments (see paragraphs 12.14 to 12.17 for further guidance).
2. Profiled or flat steel sheet at least 0.5 mm thick with an organic coating of no more than 0.2mm thickness is also acceptable.
3. Timber cladding at least 9mm thick is also acceptable.
4. 10m is measured from the top surface of the roof.
Materials and products

12.6 In a building with a storey 18m or more in height (see Diagram D6 in Appendix D) any insulation product, filler material (such as the core materials of metal composite panels, sandwich panels and window spandrel panels but not including gaskets, sealants and similar) etc. used in the construction of an external wall should be class A2-s3, d2 or better (see Appendix B). This restriction does not apply to masonry cavity wall construction which complies with Diagram 9.2 in Section 9. Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

12.7 In buildings that include a ‘residential’ purpose (purpose groups 1 and 2) with a storey 11m or more in height (see Diagram D6 in Appendix D) any insulation product, filler material (such as the core materials of metal composite panels, sandwich panels and window spandrel panels but not including gaskets, sealants and similar) etc. used in the construction of an external wall should be class A2-s1, d0 or better (see Appendix B). This restriction does not apply to masonry cavity wall construction which complies with Diagram 9.2 in Section 9. Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

12.8 Best practice guidance for green walls (also called living walls) can be found in Fire Performance of Green Roofs and Walls, published by the Department for Communities and Local Government. Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

Cavities and cavity barriers

12.9 Cavity barriers should be provided in accordance with Section 9.

12.10 In the case of an external wall construction of a building which, by virtue of paragraph 9.10d (external cladding system with a masonry or concrete inner leaf), is not subject to the provisions of Table 9.1, the surfaces which face into cavities should also meet the provisions of Table 12.1 and provisions in Section 9, but where regulation 7(2) applies, that regulation prevails over the guidance provided in Table 12.1 and Section 9.

Balconies

12.11 In buildings that include a ‘residential’ purpose (purpose groups 1 and 2) with a storey 11m or more in height (see Diagram D6 in Appendix D) balconies should meet either of the following conditions.

a. Only contain materials achieving class A1 or A2-s1, d0, except for any of the following.
   i. Cavity trays when used between two leaves of masonry.
   ii. Intumescent and fire-stopping materials where the inclusion of the materials is necessary to meet the requirements of Part B of Schedule 1 to the Building Regulations 2010.
   iii. Membranes.
   iv. Seals, gaskets, fixings, sealants and backer rods.
   v. Thermal break materials where the inclusion of the materials is necessary to meet the thermal bridging requirements of Part L of Schedule 1 to the Building Regulations 2010.
vi. Any material achieving class A1fl or A2fl-s1 when it forms the top horizontal floor layer of a balcony and is provided with an imperforate substrate under it which extends to the full size of the class A1fl or A2fl-s1 material.

vii. Electrical installations.

viii. Fibre optic cables.

b. Achieve both of the following conditions.

i. Have an imperforate soffit which extends to the full area of the balcony, achieves a minimum REI 30 rating and is constructed of materials achieving class A2-s1, d0 or better.

ii. Materials achieving class B-s1, d0 or worse extending beyond the boundary of a single compartment should include a band of material rated class A2-s1, d0 or better, a minimum of 300mm in width centred on that boundary line.

Where regulation 7(2) applies, that regulation prevails over all the provisions in this paragraph.

**Metal composite materials**

12.12 Regulation 7(1A) prohibits the use of relevant metal composite materials in the external walls of all buildings of any height.

12.13 Relevant metal composite materials are defined (in regulation 2(6)(c)) as any panel or sheet, having a thickness of no more than 10mm which is composed of a number of layers two or more of which are made of metal, alloy or metal compound and one or more of which is a substantial layer made of a material having a gross calorific value of more than 35MJ/kg when tested in accordance with BS EN ISO 1716. A substantial layer is defined as a layer which is at least 1mm thick or has a mass per unit area of at least 1kg/m².

**Regulation 7(2) and requirement B4**

**Materials**

12.14 Regulation 7(1)(a) requires that materials used in building work are appropriate for the circumstances in which they are used. Regulation 7(2) sets requirements in respect of external walls and specified attachments in relevant buildings.

**NOTE:** Further guidance on regulation 7(1) can be found in HM Government’s *Manual to the Building Regulations*.

12.15 Regulation 7(2) applies to any building with a storey at least 18m above ground level (as measured in accordance with Diagram D6 in Appendix D) and which contains one or more dwellings; an institution; or a room for residential purposes. It requires that all materials which become part of an external wall or specified attachment achieve class A2-s1, d0 or class A1 in accordance with BS EN 13501-1, other than those exempted by regulation 7(3).

**NOTE:** The above includes student accommodation, care homes, sheltered housing, hospitals, dormitories in boarding schools, hotels, hostels and boarding houses. See regulation 7(4) for the definition of relevant buildings.

**NOTE:** Transposition to national class (Table B1) does not apply to the classification in this paragraph.

12.16 External walls and specified attachments are defined in regulation 2(6) and these definitions include any parts of the external wall as well as balconies, solar panels and solar shading.

12.17 Regulation 7(3) provides an exemption for certain components found in external walls and specified attachments.
Material change of use

12.18 Regulations 5(k) and 6(3) provide that, where the use of a building is changed such that the building becomes a building described in regulation 7(4), the construction of the external walls, and specified attachments, must be investigated and, where necessary, work must be carried out to ensure they only contain materials achieving class A2-s1, d0 or class A1, other than those exempted by regulation 7(3).

Solar shading devices

12.19 Regulation 7(2) requires that the curtain and or slats of solar shading devices in a relevant building (as defined in regulation 7(4)) achieve class A1 or A2-s1, d0. The curtain of solar shading devices cannot be classified as a membrane in accordance with regulation 7(3).

12.20 Solar shading devices installed up to 4.5m above ground level are not required to meet the requirements of regulation 7(2).

Additional considerations

12.21 The provisions of regulation 7 apply in addition to requirement B4. Therefore, for buildings described in regulation 7(4), the potential impact of any products incorporated into or onto the external walls and specified attachments should be carefully considered with regard to their number, size, orientation and position.

12.22 Particular attention is drawn to the following points.

a. Membranes used as part of the external wall construction above ground level should achieve a minimum of class B-s3, d0. Roofing membranes do not need to achieve a minimum of class A2-s1, d0 when used as part of a roof connecting to an external wall.

b. Internal linings should comply with the guidance provided in Section 4.

c. Any part of a roof should achieve the minimum performance as detailed in Section 12.

d. As per regulation 7(3), window frames and glass (including laminated glass) are exempted from regulation 7(2). Window spandrel panels and infill panels must comply with regulation 7(2).

e. Thermal breaks are small elements used as part of the external wall construction to restrict thermal bridging. There is no minimum performance for these materials. However, they should not span two compartments and should be limited in size to the minimum required to restrict the thermal bridging (the principal insulation layer is not to be regarded as a thermal break).

f. Regulation 7(2) only applies to specified attachments. Shop front signs and similar attachments are not covered by the requirements of regulation 7(2), although attention is drawn to paragraph 12.22g.

g. While regulation 7(2) applies to materials which become part of an external wall or specified attachment, consideration should be given to other attachments to the wall which could impact on the risk of fire spread over the wall.

h. Any material achieving class A1fl or A2fl-s1 in accordance with BS EN 13501-1 is exempted when it meets both of the following conditions.

i. It forms the top horizontal floor layer of a balcony.

ii. It is provided with an imperforate substrate under it which extends to the full size of the class A1fl or A2fl-s1 material.
Section 13: Resisting fire spread from one building to another

Page 101 Replace paragraph 13.7 with the following.

13.7 Where a fire resisting external wall has an external surface material that is worse than class B-s3, d2 and is more than 1mm thick, that part of the wall should be classified as an unprotected area equating to half its area (Diagram 13.4).

Replace paragraph 13.9 with the following.

13.9 Exclude external walls of stairways in a protected shaft when assessing unprotected areas (see Diagram 3.3).

Page 104 Replace paragraph 13.16 with the following.

13.16 Two simple methods are given for calculating the acceptable amount of unprotected area in an external wall that is a minimum of 1000mm from any point on the relevant boundary. More precise methods are described in BRE report BR 187 and may be used instead. When using BR 187 the following radiation intensity at each unprotected area should be assumed.

a. 84kw/m$^2$ if the purpose group of the building is ‘residential’ (purpose groups 1 or 2), ‘office’ (purpose group 3) or ‘assembly and recreation’ (purpose group 5) or if the building is an open-sided multi-storey car park (purpose group 7(b)).

b. 168kw/m$^2$ if the purpose group of the building is ‘shop and commercial’ (purpose group 4), ‘industrial’ (purpose group 6) or ‘storage and other non-residential’ (purpose group 7(a)).

Section 14: Resisting fire spread over roof coverings

Page 106 Replace paragraph 14.7 with the following.

14.7 Other than for the purposes of Diagram 8.2, polycarbonate or uPVC rooflights achieving a minimum rating of class C-s3, d2 can be regarded as having a B$_{\text{ROOF(t4)}}$ classification.

Page 107 In Table 14.1 Limitations on roof coverings, replace note 3 with the following.

3. Acceptable on buildings not listed in (2) if both of the following apply.

a. Part of the roof has a maximum area of 3m$^2$ and is a minimum of 1500mm from any similar part.

b. The roof between the parts is covered with a material rated class A2-s3, d2 or better.

Section 15: Vehicle access

Page 110 Replace the first sentence of paragraph 15.1 with the following.

15.1 For small buildings (up to 2000m$^2$, with a top storey that is a maximum of 11m above ground level), vehicle access for a pump appliance should be provided to whichever is the less onerous of the following.
Page 111  Replace Diagram 15.1 with the following.

See para 15.1

Plan of building AFGL where AL and FG are walls in common with other buildings.

The footprint of the building is the maximum aggregate plan perimeter found by the vertical projection of any overhanging storey onto a ground storey (i.e. ABCDEFGMNKL).

The perimeter of the building for the purposes of Table 15.1 is the sum of the lengths of the two external walls, taking account of the footprint, i.e. (A to B to C to D to E to F) + (G to H to M to N to K to L).

If the dimensions of the building are such that Table 15.1 requires vehicle access, the green shaded area illustrates one possible example of 15% of the perimeter. Note: There should be a door into the building in this length (see paragraph 15.3).

If the building does not have walls in common with other buildings, the lengths AL and FG would be included in the perimeter.
Replace Diagram 15.2 with the following.

Diagram 15.2  Relationship between building and hardstanding/access roads for high reach fire appliances

See paras 15.8 and 15.9

- Overhead obstructions to be avoided in this zone
- Face of building at ground level or vertical plane of projecting upper storey
- Hardstanding or access road
- Obstruction

<table>
<thead>
<tr>
<th>Type of appliance</th>
<th>Turntable ladder dimension (m)</th>
<th>Hydraulic platform dimension (m)</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Maximum distance of near edge of hardstanding from building</td>
<td>4.9</td>
<td>2.0</td>
</tr>
<tr>
<td>b. Minimum width of hardstanding</td>
<td>5.0</td>
<td>5.5</td>
</tr>
<tr>
<td>c. Minimum distance of further edge of hardstanding from building</td>
<td>10.0</td>
<td>7.5</td>
</tr>
<tr>
<td>d. Minimum width of unobstructed space (for swing of appliance platform)</td>
<td>N/A</td>
<td>2.2</td>
</tr>
</tbody>
</table>

**NOTES:**

1. Hardstanding for high reach appliances should be as level as possible and should have a maximum gradient of 1 in 12.
2. Fire appliances are not standardised. Some fire services have appliances with a greater weight or different size. In consultation with the fire and rescue service, the building control body should adopt the relevant dimensions and ground loading capacity.
Section 18: Venting of heat and smoke from basements

Page 123  Replace Diagram 18.1 with the following.

Appendix A: Key terms

Page 130  Insert the following entry between the definitions of Corridor access and Dead end.

Curtain Part of a solar shading device which is set in motion by the operating system and fulfils the purpose of a blind, awning or shutter.

Page 133  Insert the following entry between the definitions of Site and *Specified attachment.

Solar shading device A device attached to an external wall for reducing heat gain or controlling visible light within a building by shading or deflecting sunlight.
Appendix B: Performance of materials, products and structures

Page 135  **Replace** paragraph B4 with the following.

**B4** Where it is proposed to assess the classification of a product or system in lieu of carrying out a specific test (as in paragraph B1c), this should be done in accordance with the relevant standard for extended application for the test in question and should include details of the test evidence that has been used to support the assessment.

For performance classifications where there is no specific standard for extended application, assessment reports should be produced in accordance with the principles of *BS EN 15725* and should include details of the test evidence that has been used to support the assessment. Further information on best practice is provided in the Passive Fire Protection Forum’s *Guide to Undertaking Technical Assessments of the Fire Performance of Construction Products Based on Fire Test Evidence*.

**NOTE:** Regulation 7(2) limits components used in or on the external walls of certain buildings to materials achieving class A2-s1, d0 or class A1 (see Section 12). Assessments cannot be used to demonstrate compliance with this requirement.

Pages 140 to 143  **Replace** paragraph B25 with the following.

**B25** This document uses the European classification system for *fire resistance* set out in *BS EN 13501-2* to 4; however, there may be some products lawfully on the market using the classification system set out in previous editions. In those situations the alternative classifications given in Table B3 can be used.

In Table B3 **Specific provisions of the test for fire resistance of elements of structure, etc., replace** rows as follows.

1. **Replace** row 2 with the following.

<table>
<thead>
<tr>
<th>2. <strong>Loadbearing wall</strong> (for a wall which is also described in any of the following items, the more onerous guidance should be applied).</th>
<th>R see Table B4</th>
<th>See Table B4</th>
<th>Not applicable</th>
<th>Not applicable</th>
<th>Each side separately</th>
</tr>
</thead>
</table>

2. **Replace** row 3b with the following.

<table>
<thead>
<tr>
<th>b. in upper storey of two storey dwellinghouse (but not over garage or basement)</th>
<th>R 30 and EI 15</th>
<th>30 min</th>
<th>15 min</th>
<th>15 min</th>
<th>From underside</th>
</tr>
</thead>
</table>

3. **Replace** row 5b with the following.

| b. any part a minimum of 1000mm from the relevant boundary | RE see Table B4 and I 15 | See Table B4 | See Table B4 | 15 min | From inside the building |
List of approved documents

The following publications give practical guidance on how to meet the Building Regulations. You can find the date of the edition approved by the Secretary of State at www.gov.uk.

**Approved Document A**
Structure

**Approved Document B**
Fire safety
- Volume 1: Dwellings
- Volume 2: Buildings other than dwellings

**Approved Document C**
Site preparation and resistance to contaminants and moisture

**Approved Document D**
Toxic substances

**Approved Document E**
Resistance to the passage of sound

**Approved Document F**
Ventilation
- Volume 1: Dwellings
- Volume 2: Buildings other than dwellings

**Approved Document G**
Sanitation, hot water safety and water efficiency

**Approved Document H**
Drainage and waste disposal

**Approved Document J**
Combustion appliances and fuel storage systems

**Approved Document K**
Protection from falling, collision and impact

**Approved Document L**
Conservation of fuel and power
- Volume 1: Dwellings
- Volume 2: Buildings other than dwellings

**Approved Document M**
Access to and use of buildings
- Volume 1: Dwellings
- Volume 2: Buildings other than dwellings

**Approved Document O**
Overheating

**Approved Document P**
Electrical safety – Dwellings

**Approved Document Q**
Security – Dwellings

**Approved Document R**
Physical infrastructure for high-speed electronic communications networks

**Approved Document S**
Infrastructure for the charging of electric vehicles

**Approved Document 7**
Materials and workmanship
