# Monkeypox contact tracing guidance: classification of contacts and advice for vaccination and follow up

## What this guidance is for

This guidance provides principles for risk assessment and follow-up of contacts of confirmed, symptomatic monkeypox cases. The infectious period is taken to be from the onset of prodromal symptoms until the complete resolution of symptoms.

Public health professionals should take into account the extent of lesions at the time of exposure, as the risk will be higher if there are widespread uncovered lesions on uncovered areas (for example, hands or face) or if the case was displaying respiratory symptoms at the time of contact compared with a small number of localised genital lesions.

Further information on monkeypox is available online.

Specific advice on vaccination with MVA-BN reinforcing dose (booster) recommendations based on prior smallpox vaccine history is available in Table 2 in the Recommendations for the use of pre and post exposure vaccination during a monkeypox incident.

## Exposure risk

- **High (category 3)**
  - Unprotected direct contact or high-risk environmental contact

## Description

- Direct exposure of broken skin or mucous membranes to a confirmed, symptomatic monkeypox case, their body fluids or potentially infectious material (including clothing or bedding) without wearing appropriate PPE

- Penetrating sharps injury (including to cleaning or laboratory staff)

- Body fluid in contact with eyes, nose, or mouth

- Penetrating sharps injury from used needle

- Person in room during aerosol-generating procedure without appropriate respiratory personal protective equipment (PPE)

- Changing a patient’s bedding without appropriate PPE

## Example scenarios

- Sexual or intimate contact with or without a condom

- Higher risk household contacts who have had close skin-to-skin contact, for example frequent touching or cuddling, or who have shared bedding, clothing or towels with the case

- Avoid contact with immunosuppressed people, pregnant women, and children aged under 5 years where possible for 21 days from last exposure

- Consider exclusion from work following a risk assessment for 21 days if work involves skin-to-skin contact with immunosuppressed people, pregnant women or children aged under 5 years (not limited to healthcare workers)

## Public health advice

- Passive monitoring

- Provide information sheet

- Avoid sexual or intimate contact and other activities involving skin-to-skin contact for 21 days from last exposure

- Avoid contact with immunosuppressed people, pregnant women or children aged under 5 years

## Recommendation for PEP

- Offer post-exposure prophylaxis (PEP) with MVA-BN vaccine (Imvanex®), ideally within 4 days from last exposure

- PEP can be offered between 5-14 days since last exposure if high risk of ongoing exposure or if contacts are immunosuppressed, pregnant women or children (school year 6 and under). Refer to the Green Book for further information

## Information sheets

- See information sheet for category 3 contacts

</table>
1. For clinical care of a confirmed case of monkeypox, appropriate PPE is a fit tested FFP3 respirator, eye protection, long sleeved, fluid repellent disposable gown, and gloves per the National infection prevention and control manual for England (p 57).

2. For assessment of a suspected case of monkeypox, appropriate PPE is a fluid resistant surgical mask (FRSM), gloves and apron. This is on the assumption that healthcare worker exposure during assessment will be shorter and more distant than for, for example, providing nursing care. If the patient has respiratory symptoms, including cough, then eye protection and an FFP3 respirator should be worn. Eye protection is also required if there is a risk of splash injury to the face and eyes (for example, if taking diagnostic samples such as throat swabs). The use of long-sleeved single use disposable gowns may be considered where extensive manual handling or unavoidable skin-to-skin contact is anticipated.

3. Severely immunosuppressed patients, as per the Green Book definition and includes those with: solid organ cancer, haematological disease and/or stem cell transplant, Child’s-Pugh class B or C liver cirrhosis, stage 4 or 5 chronic kidney disease, immune mediated inflammatory disorders (including neurological and rheumatological conditions) treated with B-cell depleting therapy within 12 months, uncontrolled HIV, solid organ transplant recipients.

4. Post exposure vaccine may be extended up to 14 days for those at high risk of ongoing exposure, for example gay, bisexual or other men who have sex with men (GBMSM) in 2022 outbreak, and some HCWs where the dose will act as their first pre-exposure dose, as well as those at risk of more severe disease such as children (school year 6 (aged 10 to 11) and under), pregnant women and immunosuppressed individuals. Refer to the recommendations for the use of pre and post exposure vaccination for further information.
