   Fossil Fuel Emissions
Reader’s Guide

Sections 1 and 2 of this Guidance document introduce the carbon emissions limits within the GB Capacity Market and how they apply.

Section 3 covers the carbon emission limits requirements that apply during the Prequalification process, including what needs to be provided within a Prequalification Application, by CMU Type, as outlined in Table 1 in Section 3.1.

Section 4 covers the carbon emission limits requirements that apply after Prequalification, to certain categories of capacity providers that have not provided a Fossil Fuel Emissions Declaration to the Delivery Body during Prequalification, with the deadlines for the different CMU type outlined in Table 2 at the end of Section 4.3.

Section 5 covers the Fossil Fuel Emissions Declaration (Exhibit ZA of the Rules).

Section 6 covers the Fossil Fuel Emissions Commitment (Exhibit ZB of the Rules). All New Build, Unproven DSR and Refurbishing CMU Applications for Prequalification must provide a Fossil Fuel Emissions Commitment to the Delivery Body.

Section 7 covers Emissions Related Material Changes.

Section 8 covers the Fossil Fuel Removal Declaration (Exhibit ZC of the Rules).

Section 9 covers the carbon emissions limits requirements for CMUs participating in Secondary Trading.

Section 10 covers which Rules and Rules amendments are applicable, in particular the Capacity Market (Amendment) Rules 2021.

Finally, Section 11 describes how carbon emissions are calculated, including detail of how and why the different formula are applied, according to component-type.

The Annexes contain illustrative examples to act as an aid to calculating carbon emissions. Annex A provides a summary of the relevant formulae that are contained within Schedule 8 of the Rules and Annex B includes a series of worked examples to demonstrate how to apply the formulae to calculate the fossil fuel emissions for a variety of circumstances.

While we recommend reading the Guidance document in its entirety, as well as the relevant Rules, please consider the following sections if the corresponding statement applies to you:

- If you are applying to prequalify for a Delivery Year commencing before 2024, please read Section 5.2 and 7.5.
- If you are applying to prequalify for a Delivery Year commencing after 2024 and are an Existing or Proven DSR CMU type, please read Sections: 3, 4, 5 and 7.
- If you are applying to prequalify for a Delivery Year commencing after 2024 and are a New Build, Unproven DSR or a Refurbishing CMU type, please read Sections: 4 and 6.

Please read the Capacity Market Rules. Reading this guidance is not a substitute for reading the Capacity Market Rules.
1. Introduction

On 4 July 2019, the recast Electricity Regulation ("the Electricity Regulation")¹ came into effect as part of the EU's Clean Energy Package². Article 22 of the Electricity Regulation³ outlines design principles for capacity mechanisms including requirements in respect of mechanisms such as the GB Capacity Market (CM). Article 22(4) introduced a requirement for capacity mechanisms to include carbon emissions limits, with a difference in treatment for capacity which started commercial production before 4 July 2019 (i.e. the date Article 22(4) came into effect) and on or after that date.

As per Article 22(5) of the Electricity Regulation, Capacity Agreements awarded before 1 January 2020 are not subject to the carbon emissions limits for the duration of the agreement. To ensure compliance with the carbon emission limits in respect of capacity participating in the early 2020 auctions only, amendments were made to the Capacity Market Rules ("the Rules") by the Capacity Market Amendment (No. 5) Rules 2019, which came into force on 18 July 2019 (prior to the Prequalification Window in 2019)⁴. Capacity Agreements awarded in the early 2020 auctions will continue to be governed by the Rules that applied at that time with regards to carbon emissions.

The Government consulted, between 22 July 2019 and 13 September 2019⁵, on arrangements for applying the carbon emissions limits in respect of ‘existing’ capacity (generating units which are Fossil Fuel Components⁶ that had a Commercial Production Start Date⁷ before 4 July 2019). Following the publication of the EU's ACER guidance on Article 22 on 17 December 2019⁸, the Government consulted further on the carbon emissions limits on arrangements for reporting and verifying carbon emissions in the CM⁹.

The Capacity Market (Amendment) (No. 2) Rules 2020 came into force on 30 June 2020¹⁰ in advance of Prequalification for the early 2021 auctions and amended the Rules to, amongst other changes, introduce a carbon emissions reporting and verification mechanism. Capacity Agreements awarded in the early 2021 auctions will largely continue to be governed by the Rules that applied at that time with regards to carbon emissions.

The Prequalification process during 2020 and early stakeholder feedback provided opportunity for review and between 5 March 2021 and 16 April 2021 the Government consulted on refinements to certain formulae and clarifications to the emissions limits¹¹. A number of changes were identified to ensure that the formulae used better reflect the carbon emissions of certain technologies and that the legislation gives full effect to our policy intent.

In respect of capacity participating in all future auctions, the Capacity Market (Amendment) Rules 2021¹² came into force on 30 June 2021 and amended the Rules to, amongst other changes, introduce

---

¹ Regulation (EU) 2019/943 on the internal market for electricity.
³ Due to the effect of s3 of the EU (Withdrawal) Act 2018, the Electricity Regulation forms part of domestic law after EU Exit and continues to apply to the CM. Article 22 is retained in its original form, with some minor amendments made to it by the Electricity and Gas (Internal Markets and Network Codes) (Amendment etc.) (EU Exit) Regulations 2020.
⁴ Capacity Market (Amendment) (No. 5) Rules 2019.
⁵ https://www.gov.uk/government/consultations/capacity-market-carbon-dioxide-emissions-limits
⁶ A Fossil Fuel Component is any generating unit (including where it is a DSR CMU component) which produces electricity using a Fossil Fuel (as per the definition of 'Fossil Fuel Component' in Rule 1.2.1).
⁷ This is how the CM implemented the distinction introduced under Article 22 in relation to the 4 July 2019 date and starting commercial production. (See the definition of ‘Commercial Production Start Date’ in Rule 1.2.1).
⁸ ACER Opinion of 17 December 2019 (No 22/2019).
¹⁰ In addition, the Capacity Market Amendment (No. 3) Rules 2020 came into force on 18 July 2020 to substitute Schedule 9 of the Rules.
¹² See the Capacity Market (Amendment) Rules 2021.
new formulae for the calculation of carbon emissions for certain technologies. The Rules require compliance with the carbon emission limits by all ‘new’ capacity (i.e. when considered against the 4 July 2019 date introduced by the Electricity Regulation, that is generating units which are Fossil Fuel Components that have a Commercial Production Start Date on or after 4 July 2019) participating in all future auctions and Delivery Years, and by all ‘existing’ capacity (i.e. with a Commercial Production Start date before 4 July 2019) in respect of auctions for the Delivery Year commencing on 1 October 2024 and all subsequent Delivery Years. This guidance uses the terms ‘new capacity’ and ‘existing capacity’ in the context of the 4 July 2019 date introduced by the Electricity Regulation, and, where used, these terms should not be confused with the terms ‘New Build CMU’ and ‘Existing CMU’ which are distinctly defined terms for the purposes of the CM.

This document provides guidance only and should not be relied on as a substitute for reading the Rules. Please consider the Rules in detail, and where necessary, seek independent legal advice to establish the obligations in respect of carbon emissions which are applicable to you.
2. The carbon emissions limits

2.1 What are the carbon emissions limits?

There are two carbon emissions limits that apply in the Capacity Market to capacity which use Fossil Fuels\(^{13}\) to produce electricity:

(a) 550g of CO\(_2\) of Fossil Fuel origin per kWh of electricity generated (“the Fossil Fuel Emissions Limit”); and

(b) 350 kg CO\(_2\) of Fossil Fuel origin on average per year per installed kWe (“the Fossil Fuel Yearly Emissions Limit”).

The carbon emissions limits apply at component level. The Rules describe a component which uses Fossil Fuels to produce electricity as a Fossil Fuel Component or an Associated Fossil Fuel Component\(^{14}\) (each a “relevant Fossil Fuel Component” for the purposes of this document).

2.2 How do you demonstrate compliance with the carbon emissions limits?

**All Prequalification applicants** must commit, as part of the application process\(^{15}\), to comply with the carbon emissions limits if awarded a Capacity Obligation for the relevant Delivery Year\(^{16}\), regardless of whether the CMU comprises, or will comprise, of a Fossil Fuel Component.

Where your CMU already comprises of a relevant Fossil Fuel Component at Prequalification, as an Applicant you are required (in most cases) to demonstrate compliance with the carbon emissions limits by providing the Delivery Body a Fossil Fuel Emissions Declaration\(^{17}\) with the Prequalification application (an “Application”, see Section 3).

2.2.1. During Prequalification

The Rules provide that CMUs will not prequalify to enter the Capacity Market where the carbon emissions limits are exceeded, therefore in order to monitor compliance by Applicants, a number of requirements arise during Prequalification which are detailed in Section 3 below. In summary:

- Applicants in respect of an Existing Generating CMU or Proven DSR CMU which includes a relevant Fossil Fuel Component must provide a valid Fossil Fuel Emissions Declaration with the

---

\(^{13}\) ‘Fossil Fuel’ is defined in Rule 1.2.1. Note that waste is not considered a fossil fuel (unless the waste is something which was produced directly or indirectly from a fossil fuel listed in Rule 1.2.1 (a) to (f) for use as a fuel for a Generating Unit, and, when burned, it produces a greenhouse gas) so energy-from-waste installations are not subject to these emissions limits.

\(^{14}\) An Associated Fossil Fuel Component is a Fossil Fuel Component which supplies electricity to a Storage Facility (i.e. a battery) via a Private Network or as an Electricity Supplier in respect of that Storage Facility (See Rule 1.2.1). ‘Storage Facility’ is defined in Regulation 2 of the Electricity Capacity Regulations 2014.

\(^{15}\) Applicants in respect of CMUs that comprise only of components with a Commercial Production Start Date before 4 July 2019 and make an application in respect of a Delivery Year before 2024 will not be required to make this declaration at Prequalification. However, in the event that such a CMU were to add any components with a Commercial Production Start Date on or after 4 July 2019 as a result of an Emissions Related Material Change, you will be required to make a declaration to align with Rule 3.4.11 when submitting a Fossil Fuel Emissions Declaration.

\(^{16}\) Other than Interconnector CMUs. See Rule 3.4.11.

\(^{17}\) In the form set out in Exhibit ZA of the Rules. Section 5 of this document considers Fossil Fuel Emissions Declarations.
Application, and will not Prequalify if the declared Fossil Fuel Emissions for a component with a Commercial Production Start Date on or after 4 July 2019 exceed the Fossil Fuel Emissions Limit. You can also confirm whether the Fossil Fuel Emissions Declaration will need to be submitted by a future deadline which allows for 12 continuous months of data to be gathered.

- Applicants in respect of an Existing Generating CMU or Proven DSR CMU which includes a relevant Fossil Fuel Component, for the Delivery Year commencing in 2024 and any subsequent Delivery Years, and in respect of what we describe in this guidance as existing capacity (i.e. a relevant Fossil Fuel Component with a Commercial Production Start Date before 4 July 2019) will not Prequalify if the declared Fossil Fuel Emissions for the component exceeds the Fossil Fuel Emissions Limit and the Fossil Fuel Yearly Emissions Limit. As in the above bullet-point, you also confirm whether the Fossil Fuel Emissions Declaration will need to be submitted by a future deadline which allows for 12 continuous months of data to be gathered in respect of any such relevant Fossil Fuel Component.

- All Applicants in respect of a New Build Generating, Unproven DSR or Refurbishing CMU must provide the Delivery Body a Fossil Fuel Emissions Commitment. A Fossil Fuel Emissions Commitment includes promises to comply with the Fossil Fuel Emissions Limit, and to provide a Fossil Fuel Emissions Declaration (which specifies carbon emissions) at a future deadline. You also confirm whether a Fossil Fuel Emissions Declaration will need to be submitted by a deadline which allows for 12 continuous months of data to be gathered.

In order for the Delivery Body to ensure the appropriate obligations are complied with in relation to the Commercial Production Start Date of a relevant Fossil Fuel Component, an Existing Generating, Proven DSR or Refurbishing (in respect of the Pre-Refurbishment component) CMU that applies to Prequalify which comprises of at least one relevant Fossil Fuel Component must confirm to the Delivery Body whether the Commercial Production Start Date of the relevant Fossil Fuel Component is before or on or after 4 July 2019.

2.2.2. After Prequalification

Following the award of Capacity Agreements, the Rules require certain categories of capacity providers to provide the Delivery Body with a Fossil Fuel Emissions Declaration before a deadline after Prequalification where one has not been provided during Prequalification. The requirements which arise after Prequalification are covered in Section 4 of this document below.

CMUs may undergo material changes which impact the carbon emissions of components contained in the CMU. The Rules anticipate this scenario to ensure that the components remain compliant with the carbon emissions limits during the course of a capacity agreement. For example, in respect of instances where a Fossil Fuel Emissions Declaration is provided to the Delivery Body and a component subsequently undergoes a material change, or where one was not provided by an Existing Generating or Proven DSR CMU which did not comprise of any relevant Fossil Fuel Components and it later includes a relevant Fossil Fuel Component. Section 7 of this guidance covers “Emissions Related Material Changes”, i.e. a term used in the Rules for where a CMU undergoes a change which impacts its previous carbon emissions.

---

18 See Rule 4.4.2(k)(i).
19 This confirmation under Rule 3.6.5(ca) and Rule 3.6.5A (Existing Generating) or Rule 3.9.5(ca) and Rule 3.9.5A (Proven DSR) is given via the Delivery Body Portal.
20 See Rule 4.4.2(k)(ii).
21 This confirmation under Rule 3.6.5(ca) and Rule 3.6.5A (Existing Generating) or Rule 3.9.5(ca) and Rule 3.9.5A (Proven DSR) is given via the Delivery Body Portal.
22 In the form set out in Exhibit ZB of the Rules. Section 6 of this document considers Fossil Fuel Emissions Commitments.
23 This declaration is made by retaining paragraphs (d), (e), (f), or (g) of Part 2 of a Fossil Fuel Emissions Commitment.
24 See Rule 3.4.5B.
The Rules amendments made by the Capacity Market (Amendment) Rules 2021 in respect of Prequalification and carbon emissions apply to Prequalification applications made, and Agreements awarded, after 30 June 2021. These amendments include the introduction of the formulae covered in Sections 11.3, 11.4 and 11.5 of this guidance below.

2.3 How the carbon emissions limits apply in respect of Demand Side Response (DSR)

It is possible for a relevant Fossil Fuel Component to be comprised in a DSR CMU. Each individual Generating Unit which is a relevant Fossil Fuel Component is subject to the carbon emissions limits, including where different components are aggregated to form one CMU such as a DSR aggregator.

You need to carefully consider the Commercial Production Start Date of each relevant Fossil Fuel Component, particularly where a DSR CMU comprises of a number of different components with different Commercial Production Start Dates.

For example, Rule 3.9.5(d) provides a potential exception from the requirement to provide a Fossil Fuel Emissions Declaration under Rule 3.9.5(a) to a Proven DSR CMU which is comprised of only relevant Fossil Fuel Components all with Commercial Production Start Dates before 4 July 2019 and which is applying for the Delivery Year commencing in 2021, 2022 or 2023. However, if the same Proven DSR CMU comprises of at least one relevant Fossil Fuel Component with a Commercial Production Start Date on or after 4 July 2019, then the exception is not available.

In order for the Delivery Body to ensure the appropriate obligations are complied with in relation to the Commercial Production Start Date of a relevant Fossil Fuel Component, an Unproven DSR CMU that notifies the Delivery Body of its components, must, when providing a Fossil Fuel Emissions Declaration, confirm to the Delivery Body whether the Commercial Production Start Date of the relevant Fossil Fuel Component is before or on or after 4 July 2019.

3. Carbon emissions limits - During Prequalification

The Rules specify requirements during Prequalification in respect of carbon emissions limits, which you should consider carefully before submitting an Application:

- If an Existing Generating, or Proven DSR CMU comprises of at least one relevant Fossil Fuel Component, subject to a few limited exceptions described in the Rules, a Fossil Fuel Emissions Declaration is required at Prequalification.

- All New Build Generating, Unproven DSR CMUs and Refurbishing CMUs Applicants must provide the Delivery Body a Fossil Fuel Emissions Commitment regardless of generating
3.1 Providing a Fossil Fuel Emissions Declaration with an Application

Table 1 below describes, in respect of each CMU type; the requirement at Prequalification for a Fossil Fuel Emissions Declaration, the relevant Rules, and summarises exceptions to the requirement to provide a Fossil Fuel Emissions Declaration with an Application.

The table assumes an Existing Generating or Proven DSR CMU comprises of at least one relevant Fossil Fuel Component when an Application is submitted. Where it does not, Table 2 in Section 4.3 of this document details scenarios in which a Fossil Fuel Emissions Declaration will be required after Prequalification.

The relevant deadline by which a Fossil Fuel Emissions Declaration must be provided in respect of each CMU type following an Emissions Related Material Change after a first Fossil Fuel Emissions Declaration is provided is considered in Section 7 of this document.

<table>

<td>An Unproven DSR CMU is not required to provide a Fossil Fuel Emissions Declaration during Prequalification.</td>
</tr>
</tbody>
</table>

If your Existing Generating or Proven DSR CMU does not comprise of at least one relevant Fossil Fuel Component, a Fossil Fuel Emissions Declaration is not required at Prequalification. However, under Rule 3.6.6 or Rule 3.9.6 (as applicable) you will need to confirm that in the event of an Emissions Related Material Change resulting in the CMU comprising of at least one relevant Fossil Fuel Component, a Fossil Fuel Emissions Declaration will be provided to the Delivery Body by the deadline in Rule 8.3.12(b)\(^{35}\) (see Table 2).

### 3.2 ‘Relying’ on a previously submitted Fossil Fuel Emissions Declaration which remains accurate

There may be circumstances where a Prequalification Applicant has already provided the Delivery Body a Fossil Fuel Emissions Declaration in relation to a CMU which still remains accurate, and a further obligation arises to provide a Fossil Fuel Emissions declaration in relation to the same CMU, whether during Prequalification or during a Delivery Year. It is possible to ‘rely’ on the Fossil Fuel Declaration already provided to the Delivery Body, rather than providing a new one where the previous declaration remains accurate.

A previous declaration remains accurate unless, in summary, the circumstances summarised below arise\(^{36}\):

a) The previous Fossil Fuel Emissions Declaration specifies values for at least one relevant Fossil Fuel Component relying on its compliance with the Fossil Fuel Yearly Emissions Limit. (The previous declaration does not remain accurate because the calculation of Fossil Fuel Yearly Emissions relies on 12 continuous months of data during an ‘Emissions Year’\(^{37}\));

b) The previous Fossil Fuel Emissions Declaration is a Transitional Fossil Fuel Emissions Declaration and the obligation to provide a Fossil Fuel Emissions Declaration arises after the opening of the Prequalification Window in 2023;

---

*\(^{35}\) See Rule 8.3.12(b). Note that, due to the effect of Rule 8.3.13A(b), only the deadline in Rule 8.3.12(b)(ii)(aa) applies to an agreement awarded in the early 2021 auctions.*

*\(^{36}\) See Rules 3.6.5(c), 3.9.5(c), and 8.3.11(d) (where a declaration has been provided in respect of the pre-Refurbishment component of a Refurbishing CMU) for example.*

*\(^{37}\) In respect of a Fossil Fuel Emissions Declaration provided with an application, this 12 month period must be within the 14 months leading up to the Prequalification Window you make your application. In respect of a Fossil Fuel Emissions Declaration provided after Prequalification, this 12 month period must be within 14 months of the date the declaration is made. See the definition of “Emissions Year” in Rule 1.2.1.*
c) The Application is for the 2024 Delivery Year or a subsequent Delivery Year and the previous Fossil Fuel Emissions Declaration was for a T-1 Delivery Year in 2021, 2022, or 2023. (The previous declaration does not remain accurate because Applicants for such auctions would not have been required to declare emissions of relevant Fossil Fuel Components with a Commercial Production Start Date before 4 July 2019);

d) The CMU has undergone an Emissions Related Material Change since the previous Fossil Fuel Emissions Declaration was provided; or

e) Where the CMU has applied any of the formulae introduced by the Capacity Market (Amendment) Rules 2021, relating to the Design Efficiency CHPQA formula and/or the Fossil Fuel Emissions CCUS Formula, Fossil Fuel Emissions Mixed Fuels Formula and Fossil Fuel Emissions Composite Formula to determine Fossil Fuel Emissions. (The previous declaration does not remain accurate because the calculation of Fossil Fuel Yearly Emissions relies on 12 continuous months of data during an 'Emissions Year').

Due to the fact that the Fossil Fuel Yearly Emissions Limit applies only to relevant Fossil Fuel Components with a Commercial Production Start Date on after 4 July 2019 and from the 2024 Delivery Year onwards, the Rules provide for a difference in treatment between Fossil Fuel Emissions Declarations provided for a Pre-2024 T-1 Delivery Year and those provided for the Delivery Year commencing on 1 October 2024 or any subsequent Delivery Year. You need to consider the Rules carefully depending on the composition of your CMU. For example, a Fossil Fuel Emissions Declaration provided for a Pre-2024 T-1 Delivery Year cannot be relied upon by an Applicant seeking to rely on the exceptions in Rule 3.6.5(b) or Rule 3.9.5(b)39.

3.3 Mandatory CMUs

Mandatory CMUs which are comprised of a relevant Fossil Fuel Component may seek to opt-out of making an Application for a Delivery Year if, in respect of that Delivery Year, the CMU will be operational but would exceed the Fossil Fuel Emissions Limit. An opt-out notification provided under Rule 3.11 will need to state this in the summary of reasons made in the notification40.

3.4 Not Prequalifying due to carbon emissions requirements

The Rules ensure that carbon emissions requirements must be complied with in order for you to Prequalify and therefore potentially access a Capacity Agreement so you must carefully consider which carbon emissions requirements you are subject to before submitting an Application.

Under Rule 4.4.2(i), an Applicant for a New Build Generating, Refurbishing or Unproven CMU (which are all required to provide a Fossil Fuel Emissions Commitment with an Application under Rule 3.7.4, 3.8.3 or Rule 3.10.4 as applicable) which fails to provide a Fossil Fuel Emissions Commitment with the Application or provides an invalid declaration will not Prequalify.

Under Rule 4.4.2(j) and (k), an Applicant in respect of an Existing Generating CMU or Proven DSR CMU which is required to provide a Fossil Fuel Emissions Declaration with an Application (under Rule 3.6.5(a) or Rule 3.9.5(a) as applicable) but fails to do so, provides an invalid declaration, or provides a Fossil Fuel Emissions Declaration which demonstrates that the carbon emissions limits have been exceeded, will not Prequalify.

---

38 An Applicant for a Delivery Year in 2022 or 2023 does not need to declare carbon emissions of a relevant Fossil Fuel Component with a Commercial Production Start Date before 4 July 2019 (see Rule 3.6.5(d) or Rule 3.9.5(d).

39 See Rules 3.6.5(c)(ii) and Rule 3.9.5(c)(ii).

40 See Rule 3.11.2A.
4. Carbon emissions limits - After Prequalification

The Rules specify requirements following the award of a Capacity Agreement, for certain categories of capacity providers to provide the Delivery Body with a Fossil Fuel Emissions Declaration where one has not been provided during Prequalification:

- An Existing Generating or Proven DSR CMU which did not comprise of a relevant Fossil Fuel Component during Prequalification (and therefore did not provide a Fossil Fuel Emissions Declaration with the Application), who subsequently comprise of a relevant Fossil Fuel Component (Section 4.1 below).

- An Existing Generating or Proven DSR CMU in respect of which a confirmation was made under Rule 3.6.5(ca) or Rule 3.9.5(ca) with the Application, where the Applicant determined that the CMU would not Prequalify if a Fossil Fuel Emissions Declaration were to be provided unless the relevant Fossil Fuel Emissions CCUS Formula and/or the Design Efficiency CHPQA Formula are applied but at the time of application did not have 12 months of data and/or the qualifying CHPQA Certificate (Section 4.2 below).

- An Existing Generating or Proven DSR CMU burning mixed fuels in respect of which a confirmation was made under Rule 3.6.5(ca) or Rule 3.9.5(ca) with the Application, where the Applicant determined that the CMU at the time of application did not have 12 months of data to apply the Fossil Fuel Mixed Fuel Formula or Fossil Fuel Emissions Composite Formula (Section 4.2 below).

- A New Build, Unproven DSR CMUs or Refurbishing CMU which, after a Capacity Agreement is awarded, comprises of a relevant Fossil Fuel Component (Section 4.3 below).

4.1 Existing Generating and Proven DSR CMUs which contained no relevant Fossil Fuel Components during Prequalification

Existing Generating and Proven DSR CMUs without any relevant Fossil Fuel Components are not required to submit a Fossil Fuel Emission Declaration at Prequalification. However, under Rule 3.6.6 or Rule 3.9.6 (as applicable) an Applicant in respect of the CMU will have confirmed that in the event of an Emissions Related Material Change resulting in the CMU comprising of at least one relevant Fossil Fuel Component, a Fossil Fuel Emissions Declaration will be provided to the Delivery Body by the deadline in Rule 8.3.12(b). Table 2, at the end of Section 4, sets out the relevant deadline for each CMU type.

Emissions Related Material Changes are covered in Section 7 of this document and include, for example, the development of a new generating unit onsite or, for a DSR CMU, component reallocation.

---

41 This also applies to CMUs in respect of which the Applicant made a confirmation under Rule 3.6.5(d) or Rule 3.9.5(d).
42 Or Rule 3.6.7 or Rule 3.9.7 where an Applicant made the confirmation in Rule 3.6.5(d) or 3.9.5(d) respectively.
43 Note that, due to the effect of Rule 8.3.13A(b), only the deadline in Rule 8.3.12(b)(ii)(aa) applies to an Agreement awarded in the early 2021 auctions.
4.2 Existing Generating and Proven DSR CMUs in respect of which a confirmation under Rule 3.6.5(ca) and Rule 3.6.5A or Rule 3.9.5(ca) and Rule 3.9.5A was made

Some Existing Generating and Proven DSR CMUs which comprised of a relevant Fossil Fuel Component will have made the declarations under Rule 3.6.5 (ca) and Rule 3.6.5A or Rule 3.9.5 (ca) and Rule 3.9.5A during Prequalification instead of providing a Fossil Fuel Emissions declaration with an Application. This is because at the time of submitting the Application, they intended to/needed to apply the mixed fuels, CCUS and/or the CHP formulae but at the time of application the CMU did not have 12 months of data and/or the relevant CHPQA Certificate. In respect of CHP and CCUS, during Prequalification, they also determined that the CMU would not prequalify if a Fossil Fuel Emissions Declaration were to be provided without the relevant Fossil Fuel Emissions CCUS Formula and/or the Design Efficiency CHPQA Formula. Table 2, at the end of Section 4, sets out the relevant deadline for each CMU type.

4.3 New Build, Refurbishing and Unproven DSR CMUs

All New Build, Refurbishing and Unproven DSR CMUs provide the Delivery Body with a Fossil Fuel Emissions Commitment at Prequalification under Rule 3.7.4, 3.8.3 or 3.10.4 (as applicable).

Rule 8.3.11 sets out the deadline by which a Fossil Fuel Emissions Declaration must be provided to the Delivery Body if, after Prequalification, the CMU comprises of a relevant Fossil Fuel Component. The deadlines vary depending on CMU type.

If, by the time the Capacity Agreement takes effect, a CMU does not comprise of any relevant Fossil Fuel Components, Rule 8.3.11 will not be applicable and the capacity provider will not be required to submit a Fossil Fuel Emission Declaration (i.e. the deadlines will not become applicable). This will probably be the case, for example, for a Generating CMU in a non-dispatchable generating technology class, such as offshore wind.

In respect of a CMU which, during Prequalification, the Applicant anticipated that it will or may comprise of a relevant Fossil Fuel Component, however you subsequently choose not to develop that or any Fossil Fuel Component, confirmation that a Fossil Fuel Emissions Declaration will not be submitted should be communicated to the Delivery Body in writing/by email. Table 2 below sets out the relevant deadline for each CMU type.

Table 2 – Deadlines for submission of a Fossil Fuel Emissions Declaration (after Prequalification).

<table>
<thead>
<tr>
<th>CMU Type</th>

</tbody>
</table>

### 4.4 Termination in respect of carbon emissions

Under Rule 8.3.14(b), the Termination Event in Rule 6.10.1(o) will apply if, after being awarded a Capacity Agreement, the Delivery Body is made aware that a CMU made a declaration in a Fossil Fuel Emissions Commitment, a Fossil Fuel Emissions Declaration or during Prequalification (in respect of carbon emissions) and did not provide a Fossil Fuel Emissions Declaration when required to under any of Rule 8.3.11, Rule 8.3.12, Rule 8.3.12A or Rule 8.3.13 (i.e. any of the Rules which contain the

---

49 An Applicant for a Refurbishing CMU must specify in any confirmation notice pursuant to Rule 5.5.14 whether or not it also wishes to participate in the Capacity Auction with respect to the associated Pre-Refurbishment CMU. (See Rule 5.5.15).
50 The Pre-Refurbishment CMU means, in relation to a Refurbishing CMU, the Existing CMU that would remain in the absence of any improvement works being carried out. (See definition in Rule 1.2.1).
51 i.e. Due to paragraph (c) of Part 2 of Exhibit ZB.
52 i.e. Due to Parts 5 and 7 of Exhibit ZA.
53 Under Rule 3.4.11.
deadlines for providing a Fossil Fuel Emissions Declaration) or if the carbon emissions limits are exceeded.

5. The Fossil Fuel Emissions Declaration (Exhibit ZA)

The purpose of a Fossil Fuel Emissions Declaration is to require information and evidence which demonstrates compliance with the carbon emissions limits in respect of relevant Fossil Fuel Components comprised in a CMU, and to require commitments in respect of potential Emissions Related Material Changes\(^\text{54}\) to a CMU in the future. Exhibit ZA of the Rules sets out the content and form of a Fossil Fuel Emissions Declaration which must be used. Parts 1 and 2 (including the relevant sections identified in Part 2) as well as Parts 5, 7 and 8 of the Fossil Fuel Emissions Declaration must always be completed.

5.1 Relevant Fossil Fuel Components with an Installed Capacity under 1 MW

Most of the information and evidence required in a Fossil Fuel Emissions Declaration is in respect of demonstration of compliance with the carbon emissions limits by relevant Fossil Fuel Components with an Installed Capacity\(^\text{55}\) equal to or above 1MW.

However, Part 5 of the Fossil Fuel Emissions Declaration must also be completed in respect of existing or potential future Fossil Fuel Components with an Installed Capacity under 1 MW. This means that a Fossil Fuel Emissions Declaration is required even where a CMU is only comprised of relevant Fossil Fuel Components with an Installed Capacity under 1 MW. In such a case, as the Fossil Fuel Emissions Declaration will not contain values for Fossil Fuel Emissions or Fossil Fuel Yearly Emissions (in Part 3 of the Declaration), the Fossil Fuel Emissions Declaration does not need to be verified by an Independent Emissions Verifier.

As set out in Table 1 of this document, an Applicant in respect of an Existing Generating or Proven DSR CMU may benefit from an exception from the requirement to provide a Fossil Fuel Emissions Declaration during Prequalification if the Application relates to a Pre-2024 Delivery Year, and the only relevant Fossil Fuel Components comprised in the CMU have a Commercial Production Start Date before 4 July 2019\(^\text{56}\).

However, Part 5 of a Fossil Fuel Emissions Declaration is still required to be completed if an Existing Generating or Proven DSR CMU submits an Application for a T-1 auction relating to a Pre-2024 Delivery Year if it contains one or more components under 1 MW with a Commercial Production Start Date on or after 4 July 2019.

Also if, for example, an Unproven DSR CMU is required to provide a Fossil Fuel Emissions Declaration\(^\text{57}\) in relation to a Pre-2024 Delivery Year, and the CMU comprises of a mix of components with an Installed Capacity under 1 MW with a Commercial Production Start Date on or after 4 July 2019 and components with an Installed Capacity equal to or above 1 MW with a Commercial Production Start Date on or after 4 July 2019.

---

\(^{54}\) See Section 7 of this document in respect of Emissions Related Material Changes.

\(^{55}\) Installed Capacity is the nominal (or ‘nameplate’) capacity of a Generating Unit or DSR CMU Component, in MW. (See definition in Rule 1.2.1.)

\(^{56}\) Subject to making the confirmation in Rule 3.6.5(d) or Rule 3.9.5(d) as applicable.

\(^{57}\) By the relevant deadline in Rule 8.3.11(b).
Carbon Emissions Limits in the Capacity Market

Date before 4 July 2019, we would expect Part 5 of a Fossil Fuel Emissions Declaration to be completed.\(^{58}\)

5.2 A CMU comprised of a relevant Fossil Fuel Component with an Installed Capacity above 1 MW and a Commercial Production Start Date before 4 July 2019 applying for a Pre-2024 Delivery Year

A Fossil Fuel Emissions Declaration which is provided by a T-1 Applicant or Capacity Provider for the Delivery Years in 2021, 2022 and 2023, does not need to specify the Fossil Fuel Emissions nor Fossil Fuel Yearly Emissions of a relevant Fossil Fuel Component with an Installed Capacity equal to or over 1 MW with Commercial Production Start Date before 4 July 2019.

For example, if you are T-1 Applicant for a Proven DSR CMU which is comprised of a mix of relevant Fossil Fuel Components, some of which have Commercial Production Start Dates before 4 July 2019 and some after 4 July 2019, and you are applying to Prequalify for the 2022 Delivery Year, you do not need to specify the Fossil Fuel Emissions of the relevant Fossil Fuel Components which have a Commercial Production Start Date before 4 July 2019.\(^{59}\) However, you do need to specify the Fossil Fuel Emissions of the relevant Fossil Fuel Components which have a Commercial Production Start Date on or after 4 July 2019. This is because relevant Fossil Fuel Components with an Installed Capacity above 1 MW with a Commercial Production Start Date before 4 July 2019 are subject to the carbon emissions monitoring and verification requirements from the 2024 Delivery Year onwards.

5.3 ISO and EN standards

Part 6(a) of Exhibit ZA requires you to describe the ISO (International Organisation for Standardisation) or EN (European Standards) standard/s applied in respect of the values used to calculate the Fossil Fuel Emissions specified. You have discretion whether to apply an ISO Standard (or where ISO Standards are not available, an EN Standard), and which one standard to apply, because the ISO or EN Standards which may be applied will depend on the generating technology comprised in a relevant Fossil Fuel Component.

Where an ISO Standard or EN Standard is applied, this must be confirmed in the declaration and a description of the standard (e.g. title, number, date of publication) provided with the supporting information submitted alongside the Fossil Fuel Emissions Declaration. The standard/s applied only need to be described, no evidence needs to be provided of the standard/s’ specific application in any formulae. If no ISO or EN standards are applied, for the avoidance of doubt, you should confirm this alongside the Fossil Fuel Emissions Declaration.

5.4 Independent Verification

Other than in respect of “Transitional Fossil Fuel Emissions Declarations” (see 5.4.1 of this Section), Fossil Fuel Emissions and Fossil Fuel Yearly Emissions included in Part 4 of a Fossil Fuel Emissions Declaration

---
\(^{58}\) In such circumstances, you should explain the composition of the CMU in a cover letter to the Delivery Body.

\(^{59}\) See Rule 3.15.3.
Declarations will need to be independently verified by an Independent Emissions Verifier\(^60\) (“IEV”), accredited by UKAS (or equivalent international body) for the verification of calculations and values included in a Fossil Fuel Emissions Declaration. Information on accredited IEVs is available on UKAS’ website at [https://www.ukas.com/accreditation/about/developing-new-programmes/development-programmes/ecm-verification/](https://www.ukas.com/accreditation/about/developing-new-programmes/development-programmes/ecm-verification/).

5.4.1. Transitional Fossil Fuel Emissions Declarations

Fossil Fuel Emissions Declarations provided for Prequalification in 2022, and before the commencement of the Prequalification Window in 2023, are “Transitional Fossil Fuel Emissions Declarations”, and do not need to be independently verified by an IEV.\(^61\) This means that a Fossil Fuel Emissions Declaration provided at any point from the opening of the Prequalification Window in 2023 may need to be independently verified by an IEV - you will need to plan for this in advance.

As per Rule 3.6.5(c)(i) in respect of Existing Generating CMUs, and Rule 3.9.5(c)(i) in respect of Proven DSR CMUs, it will not be possible to rely on a Transition Fossil Fuel Emissions Declaration when making a confirmation under Rule 3.6.5(b) or Rule 3.9.5(b) in any subsequent Application. Similarly, under Rule 8.3.11(d)(i), a Refurbishing CMU will be unable to rely on a Transitional Fossil Fuel Emissions Declaration when making a declaration under Rule 8.3.11(c).

5.4.2. Having a Fossil Fuel Emissions Declaration independently verified

To reduce the risk of a shortage of access to IEVs at a critical time, we recommend that, where possible, in respect of declarations you intend to provide to the Delivery Body at any point from the start of the 2023 Prequalification Window, you seek to have more straightforward Fossil Fuel Emissions Declarations (which do not specify Fossil Fuel Yearly Emissions or rely on one or more the Fossil Fuel Emissions CCUS Formula, Fossil Fuel Emissions Mixed Fuels Formula and Fossil Fuel Emissions Composite Formula and/or the Design Efficiency CHPQA Formula) verified by an IEV in good time ahead of the 2023 Prequalification Window.

In subsequent Prequalification Applications, provided that no Emissions Related Material Change takes place after the Fossil Fuel Emissions Declaration has been verified, you may then seek to make a confirmation under Rule 3.6.5(b) in respect of an Existing Generating CMU, Rule 3.6.5(b) in respect of a Proven DSR CMU and Rule 8.3.11(c) in respect of a Refurbishing CMU.

It is your responsibility to ensure that, where applicable, Fossil Fuel Emissions Declarations are independently verified in good time to meet the end of the Prequalification period or any other applicable deadlines.

5.5 A CMU with a multi-year Capacity Agreement

If your CMU holds multi-year Capacity Obligations, and you are required to provide a Fossil Fuel Emissions Declaration by the Rules, you are not expected to submit a further Fossil Fuel Emissions Declaration in relation to every Delivery Year of the Capacity Agreement, once you have fulfilled the relevant obligation in the Rules, unless, subsequent to providing a Fossil Fuel Emissions Declaration, an Emissions Related Material Change occurs (see Section 7 below).

---

\(^{60}\) Note that the requirements of an “Independent Emissions Verifier” are different from an “Independent Technical Expert”. See the definition of “Independent Emissions Verifier” in Rule 1.2.1.

\(^{61}\) See Rule 3.15.2 and the definition of ‘Transitional Fossil Fuel Emissions Declaration’ as amended by the Capacity Market (Amendment) (No.2) Rules 2022.
6. The Fossil Fuel Emissions Commitment (Exhibit ZB)

The purpose of a Fossil Fuel Emissions Commitment (Exhibit ZB) is to require an Applicant to make commitments in respect of the carbon emissions of any relevant Fossil Fuel Component which will potentially comprise in the CMU. CMUs that seek to prequalify as New Build, Refurbishing or Unproven DSR will need to provide the Delivery Body a Fossil Fuel Emissions Commitment with an Application at Prequalification.

All Prequalification applicants in respect of a New Build, Unproven DSR or Refurbishing CMU, must provide the Delivery Body a Fossil Fuel Emissions Commitment. This includes CMUs that do not include (or are not expected to include) any relevant Fossil Fuel Component. If the CMU is successful in securing a capacity agreement and it includes a relevant Fossil Fuel Component, it will need to submit a Fossil Fuel Emissions Declaration at a later date, as indicated at Table 1 in this document.

6.1 Entering the same CMU in different Prequalification Windows

An Applicant which enters the same CMU in different Prequalification Windows and the classification of the CMU does not change (whether New Build, Refurbishing or Unproven DSR) will need to submit a separate Fossil Fuel Emissions Commitment with each Application.

If your CMU is successful in securing multiple Capacity Agreements in different auctions and the CMU subsequently includes at least one relevant Fossil Fuel Component, you will need to provide a Fossil Fuel Emissions Declaration at the deadline indicated in Table 2 in respect of the agreement which has the earliest Delivery Year (if the CMU comprises of a relevant Fossil Fuel Component).

You can, at the same time, provide the same Fossil Fuel Emissions Declaration in respect of every other Capacity Agreement which has a different Delivery Year for which a Fossil Fuel Emissions Commitment has been submitted and a Fossil Fuel Emissions Declaration is due. Alternatively, you will be able to submit another Fossil Fuel Emissions Declaration before the next deadline which is applicable to the CMU.

---

62 See Rule 3.7.4 in respect of New Build CMUs, Rule 3.8.3 in respect of Refurbishing CMUs, and Rule 3.10.4 in respect of Unproven DSR CMUs.

63 The relevant deadline under Rule 8.3.11(b).
7. Emissions Related Material Changes

7.1 What is an Emissions Related Material Change?

Rule 8.3.12 and Rule 8.3.13 contain requirements for a Fossil Fuel Emissions Declaration to be provided following an ‘Emissions Related Material Change’.64

‘Emissions Related Material Change’ is defined in Rule 1.2.1. In respect of a CMU, it means adding a Fossil Fuel Component or Storage Facility which has part or all of its electricity requirements met by an Associated Fossil Fuel Component that has an Installed Capacity equal to or greater than 1 MW; and in respect of a Fossil Fuel Component that has an Installed Capacity equal to or greater than 1 MW (including where that Fossil Fuel Component is an Associated Fossil Fuel Component) means any change which alters its Fossil Fuel Emissions or Fossil Fuel Yearly Emissions. For a Fossil Fuel Component or Associated Component that has an Installed Capacity below 1 MW, an Emissions Related Material Change is any change that increases the Installed Capacity to 1 MW or more.

An example of an Emissions Related Material Change to a CMU is adding a Fossil Fuel Component when undertaking component reallocation in a DSR CMU. Examples of Emissions Related Material Changes to a relevant Fossil Fuel Component are a change of fuel or a refurbishment of a turbine in one of the components which alters its carbon emissions.

Routine maintenance or interventions aimed at resolving a fault that do not alter the outcome of the emissions calculations do not constitute an Emissions Related Material Change to a relevant Fossil Fuel Component. Removal of a relevant Fossil Fuel Component from a CMU does not constitute an Emissions Related Material Change as it does not alter the carbon emissions of other relevant Fossil Fuel Components65. A change to a relevant Fossil Fuel Component with an Installed Capacity below 1 MW is not an Emissions Related Material Change unless the change means the component goes over 1 MW of Installed Capacity.

7.2 Existing Generating and Proven DSR CMUs which contained no relevant Fossil Fuel Components during Prequalification

Under Rule 8.3.12, if an Existing Generating or Proven DSR CMU does not comprise of one or more relevant Fossil Fuel Component at the time of Prequalification, but following an Emissions Related Material Change includes one or more relevant Fossil Fuel Component, it should provide its first Fossil Fuel Emissions Declaration to the Delivery Body by the deadline specified in Rule 8.3.12(b), unless a declaration under Rule 3.6.5A or 3.9.5A was made at Prequalification in which case the deadlines specified in Rule 8.3.12A(b) apply.

---

64 Note that, due to the effect of 8.3.13A, only the deadlines in Rule 8.3.12(b)(ii)(aa) and Rule 8.3.13(c) (ii), (iii) and (iii) apply to an agreement awarded in the early 2021 auctions.

65 Where all relevant Fossil Fuel Components are removed, then a Fossil Fuel Removal Declaration is required under Rule 8.3.15 (see Section 9 of this document).
7.3 A CMU which, after providing a Fossil Fuel Emissions Declaration, undergoes an Emissions Related Material Change

Under Rule 8.3.13, where a Capacity Provider has previously provided a Fossil Fuel Emissions Declaration, following an Emissions Related Material Change an 'Updating Fossil Fuel Emissions Declaration' will be required by the deadline in 8.3.13(c).

The Updating Fossil Fuel Emissions Declaration must relate to all relevant Fossil Fuel Components previously specified, even where a component has not been subject to an Emissions Related Material Change, and should include fully re-calculated values and seek independent re-verification where appropriate. Any deadline requirements relating to the calculations used are detailed in Section 3. An Updating Fossil Fuel Emissions Declaration should be viewed as a replacement of the Fossil Fuel Emissions Declaration, which was made before the Emissions Related Material Change, rather than an amendment to it.

7.4 A CMU with multiple Capacity Agreements which undergoes an Emissions Related Material Change

A CMU with multiple Capacity Agreements for different Delivery Years that undergoes an Emissions Related Material Change is required to provide an Updating Fossil Fuel Emissions Declarations in respect of the CMU to meet the obligation under Rule 8.3.13 under each agreement. In such circumstances, you may submit an Updating Fossil Fuel Emissions Declaration to comply with the obligation in relation to one of the agreements, and then confirm to the Delivery Body that they rely on that same Updating Fossil Fuel Emissions Declaration in relation to fulfilling the obligation to provide an Updating Fossil Fuel Emissions Declaration in respect of all other existing agreements.

7.5 An Emissions Related Material Change to a CMU with a Pre-2024 Capacity Agreement

A capacity provider for a CMU in respect of which a Fossil Fuel Emissions Declaration is not provided with an Application for a Delivery Year before 2024/25 because the CMU included only relevant Fossil Fuel Components with a Commercial Production Start date before 4 July 2019 will need to have regard to the requirement for a Fossil Fuel Emissions Declaration in Rule 8.3.12 if, following a Emissions Related Material Change, the CMU acquires one or more relevant Fossil Fuel Components with a Commercial Production Start Date on or after 4 July 2019. This is because the relevant Fossil Fuel Components with a Commercial Production Start Date on or after 4 July 2019 will be subject to the emissions limits for any Delivery Year before 2024/25.

A capacity provider for a CMU with an agreement for a Pre-2024 T-1 Delivery Year which provides a Fossil Fuel Emissions Declaration due to comprising of relevant Fossil Fuel Components with a Commercial Production Start Date on or after 4 July 2019, then following an Emissions Related Material Change only comprises of relevant Fossil Fuels Components with a Commercial Production start date before 4 July 2019 is not required to submit an Updating Fossil Fuel Declaration under Rule 8.3.13 as

---

66 See the definition of this term in Rule 1.2.1. An Updating Fossil Fuel Emissions Declaration will also be in the form of Exhibit ZA and must meet the requirements in Rule 3.15.
67 See Rule 8.3.12(a)(ii)(aa).
the removal of one or more fossil fuel components is not considered an Emissions Related Material Change.

7.6 DSR Component Reallocation

Capacity Providers for Proven DSR CMUs will need to consider whether a first Fossil Fuel Emissions Declaration or Updating Fossil Fuel Emissions Declaration is required under Rule 8.3.12(b) or Rule 8.3.13(a) following DSR component reallocation because such a change is an Emissions Related Material Change where a relevant Fossil Fuel Component is added or removed.

For example, a DSR CMU which undergoes component reallocation during a Delivery Year of an Agreement (which we will call “Agreement A”) will, unless it has a multi-year obligation and has not yet met the requirements in Rule 8.3.2 (DSR Test) and Rule 8.3.6 (Evidence of Total Project Spend), be required to provide the Delivery Body an Updating Fossil Fuel Emissions Declaration.

If the CMU is awarded a separate Agreement which begins the Delivery Year after end of Agreement A (which we will call “Agreement B”), following a component reallocation during Agreement A, you will need to provide the Delivery Body a new DSR Test Certificate. In this case, in respect of Agreement B, as the CMU is classified Unproven DSR, a Fossil Fuel Emissions Declaration will need to be provided by the date you provide the DSR Test Certificate for Agreement B if the CMU comprises of a relevant Fossil Fuel Component. This is the case even if you have provided the Delivery Body an Updating Fossil Fuel Emissions Declaration under Rule 8.3.13 in accordance with Rule 8.3.4(h) and 8.3.11 for Agreement A. You could, where the deadlines for Agreement A and Agreement B align, submit two copies of the same Fossil Fuel Emissions Declaration to fulfil both obligations where the emissions data/information relate to the same relevant Fossil Fuel Components.

If your CMU does not undergo component reallocation, or a new DSR Test Certificate is provided to the Delivery Body ahead of you entering the same CMU for Prequalification for a capacity auction for a subsequent Agreement, and the CMU is classified as a Proven DSR CMU in that Application, you may be able to rely on the Updating Fossil Fuel Emissions Declaration it submitted following the component reallocation.

7.7 A relevant Fossil Fuel Component using formulae relying on 12 months of data undergoing an Emissions Related Material Change

The deadlines for provision of a Fossil Fuel Emissions Declaration take account of circumstances where a relevant Fossil Fuel Component needs to use 12 months of data in a formula to determine its Fossil Fuel Emissions or Fossil Fuel Yearly Emissions.

For example, a CMU that has one or more components must submit an Updating Fossil Fuel Emissions Declaration within two months of an Emissions Related Material Change taking place, unless the

---

68 Where the requirements in Rule 8.3.12(a) are met in respect of a first Fossil Fuel Emissions Declaration, or 8.3.13(b) in respect of an Updating Fossil Fuel Emissions Declaration.
69 By the applicable deadline in Rule 8.3.13(c) (See Rule 8.3.4(n)). Within the 5 Working Days provided for notification under Rule 8.3.4(n), if you do not provide the Delivery Body the Fossil Fuel Emissions Declaration, you must inform the Delivery Body in writing of which deadline in Rule 8.3.13(c) is applicable to you.
70 See Rule 8.3.11. You must inform the Delivery Body in writing by the date you provide the DSR Test Certificate if you intend to rely on one of the later deadlines in Rule 8.3.11(b)(iii).
71 See Rule 3.9.5(b).
change affects directly one or more of the components that rely on the Fossil Fuel Yearly Emissions Limit, in which case the deadline is 14 months from the change, to allow these components to gather 12 months of data.\textsuperscript{72}

For CMUs which comprise of one or more components relying on one or more of the Fossil Fuel Emissions CCUS Formula, Fossil Fuel Emissions Mixed Fuel Formula, Fossil Fuel Emissions Composite Formula and/or Design Efficiency CHPQA Formula, the deadline varies depending on which formula is applicable and you should consider Rule 8.3.13(c) carefully to determine which deadline applies to you. If your CMU comprises of numerous relevant Fossil Fuel Components, each relying on a different formula, for example one component relies on the Fossil Fuel Emissions Mixed Fuel Formula, and one relies on the Design Efficiency CHPQA Formula, then the latest deadline is the one that applies to provision of the Fossil Fuel Emissions Declaration (in the example, it would be the deadline in Rule 8.3.13(c)(v)) This is the case irrespective of whether the change affects the component relying on the relevant formula or not.

\textsuperscript{72} See Rule 8.3.13(c)(i) and (c)(iii).
8. The Fossil Fuel Removal Declaration (Exhibit ZC)

The purpose of a Fossil Fuel Removal Declaration is to require you to provide evidence to the Delivery Body which demonstrates that, subsequent to a Fossil Fuel Emissions Declaration being provided in respect of a CMU, the CMU no longer comprises of at least one relevant Fossil Fuel Component where previously the CMU did comprise of at least one relevant Fossil Fuel Component. Exhibit ZC of the Rules sets out the content and form of a Fossil Fuel Removal Declaration which must be used.

Under Rule 8.3.15, a Fossil Fuel Removal Declaration is required if a CMU no longer contains any relevant Fossil Fuel Components e.g. following component reallocation in a DSR CMU which removes all Fossil Fuel Components, or refurbishment of a component so that it will not produce electricity using a Fossil Fuel. A Fossil Fuel Removal Declaration must be provided as soon as reasonably practicable after the Emissions Related Material Change which leads to the CMU no longer comprising of any relevant Fossil Fuel Component.
Carbon Emissions Limits in the Capacity Market

9. Secondary Trading

CMUs participating in Secondary Trading as an ‘Acceptable Transferee’ under Rule 9.2.4 for the Delivery Year commencing on 1 October 2021 and any subsequent Delivery Year will need to comply with the carbon emissions limits, as applicable.

For example, to Prequalify as an Eligible Secondary Trading Entrant73 for the Delivery Year commencing on 1 October 2021, a Fossil Fuel Emissions Declaration will need to be submitted in respect of an Existing Generating CMU which comprises of one or more relevant Fossil Fuel Component74 with a Commercial Production Start Date on or after 4 July 2019. However, no declaration is due if the CMU only comprises of components with a Commercial Production Start Date before 4 July 2019.

For the Delivery Year commencing on 1 October 2024 and all subsequent delivery years, a Fossil Fuel Emissions Declaration is necessary in order to requalify as an Eligible Secondary Trading Entrant for any CMUs which comprise of a relevant Fossil Fuel Component, irrespective of the Commercial Production Start Date.75

You should consider the requirements in the Rules carefully when considering a secondary trade in respect of a CMU which comprises of a relevant Fossil Fuel Component. For example, for a person to be an ‘Acceptable Transferee’ in respect of a CMU which comprises of one or more relevant Fossil Fuel Components, a Fossil Fuel Emissions Declaration will need to be provided to the Delivery Body if one has not previously been provided76 and the person will need to confirm to the Delivery Body whether the Fossil Fuel Component has a Commercial Production Start Date before, on, or after 4 July 2019.77

---

73 Following an application from a Secondary Trading Entrant under Rule 3.13.
74 As per the requirement in Rule 3.6.5(a).
75 Any Fossil Fuel Emissions Declaration submitted before the Prequalification Window in 2023 is a ‘Transitional Fossil Fuel Emissions Declaration’ and does not need to be verified by an IEV.
76 See Rule 9.2.6(e)(x) in respect of the Delivery Years commencing in 2021, 2022, and 2023, and Rule 9.2.6(e)(xi) in relation to Delivery Years commencing in 2024 or subsequently. Note that in respect of Delivery Years commencing in 2024 or subsequently, a Fossil Fuel Emissions Declaration will be required even where one has been provided previously in relation to the Delivery Years commencing in 2021, 2022, and 2023 due to the exception in Rule 9.2.6(e)(xi).
77 See Rule 9.2.6(e)(xii).
10. Applicability of Rules amendments

As is the case with many of the Rules, the Rules applicable at the time a Capacity Agreement is awarded will continue to be effective for the duration of the agreement in question. Amendments to the Rules will also be applicable unless the ‘application’ provision of the Rules instrument which amends those Rules says otherwise (for example, it says the amendments only apply to future agreements).

For example, Capacity Agreements awarded before the prequalification window in 2019 are not subject to the carbon emissions limits for the duration of the agreement as these were awarded before any carbon emissions requirements were introduced to the Rules. Capacity Agreements awarded in the early 2021 auctions were awarded after the Rules were amended in June 2020 and were subject to several carbon emissions requirements during Prequalification, some of which will now apply differently for Prequalification Applications made after 30 June 2021, following the Capacity Market (Amendment) Rules 2021 coming into force.

The Rules have been amended by the Capacity Market (Amendment) Rules 2021 so that Rules which have been introduced and relate to carbon emissions requirements which fall on a person after Prequalification (i.e. the new formulae and associated deadlines relating to the Fossil Fuel Emissions CCUS Formula, Fossil Fuel Emissions Mixed Fuels Formula and Fossil Fuel Emissions Composite Formula and/or the Design Efficiency CHPQA Formula) will not apply to agreements awarded in the early 2021 auctions.

The template Fossil Fuel Emissions Declaration (Exhibit ZA) was substituted by the Capacity Market (Amendment) Rules 2021, so the substituted version (i.e. the most recent version) of the template Fossil Fuel Emissions Declaration document (Exhibit ZA) should be used to fulfil an obligation which arises at any point in the future in respect of agreements awarded in the capacity auctions in early 2021 and in subsequent auctions.

---

78 By the Capacity Market (Amendment) (No.2) Rules 2020 and the Capacity Market (Amendment) (No.3) Rules 2020.

79 For example, in respect of the deadline applicable where an Updating Fossil Fuel Emissions Declaration is submitted following an Emissions-Related Material Change, or where a CMU submits a Fossil Fuel Emissions Declaration after Prequalification having submitted a Fossil Fuel Commitment at Prequalification.

80 See Rule 8.3.13A.

81 For example, New Build/Refurbishing/Unproven DSR CMUs awarded in agreement in early 2021 which are required to provide a Fossil Fuel Emissions Declaration by the deadline in Rule 8.3.11, or Existing/Proven DSR CMUs who are required to provide an Updating Fossil Fuel Emissions Declaration under Rule 8.3.13.
11. How to calculate carbon emissions

This section provides guidance on how to calculate the Fossil Fuel Emissions and, if required, the Fossil Fuel Yearly Emissions of a relevant Fossil Fuel Component using the formulae provided in Schedule 8 of the Rules. You should consider Schedule 8 of the Rules carefully before making an application for Prequalification and seek expert advice on any calculations which you make when determining carbon emissions for inclusion in a Fossil Fuel Emissions Declaration, as this document provides a summary only.

11.1 Fossil Fuel Emissions

The Fossil Fuel Emissions (“FFE”) of a Generating Unit is a value expressed in grams of carbon dioxide per kWhe and is determined in accordance with the following formula:\(^2\)  \(^3\)

\[
FFE = \frac{0.0036 \times EF_{f,CO2}}{\eta_{des}} = \left[ \frac{\text{gCO}_2}{\text{kWhe}} \right]
\]

Note the following when applying this formula:

- 0.0036 is a set value for a conversion factor (1 kWh equal to 0.0036 GJ) which must not be altered.
- The Emission Factor (“EF\(_{f,CO2}\)”) is determined by using the value specified in the table in Schedule 9 of the Rules corresponding to the fuel used by a Generating Unit.
- When determining Design Efficiency (“\(\eta_{des}\)”) in accordance with the relevant formula in Part 3 of Schedule 8 to the Rules, the values deemed to be most representative of the normal operation of the Generating Unit should be used, where applicable, for each variable.
- When calculating the FFE, all input values except the defined conversion factor should be maintained to two decimal places.
- As this is a theoretical calculation, based on the design of the Generating Unit and the fuel utilised, a Generating Unit’s FFE should not change year on year (unless the component undergoes an Emissions Related Material Change).
- Only fuels used to produce electricity should be considered for the calculation of FFE. Fuels that are used for the purposes of start-up, cool-off and flame-control activities should not be taken into account when calculating the FFE of the Generating Unit and should not be considered when determining whether a component is a mixed fuels component.

If a Generating Unit is equipped with CCUS technology, Table 3 outlines the specific formulae that you may choose to apply for these cases and they are described in further detail in Section 11.4. In the case of Generating Units using more than one fuel the alternative formulae that must be applied are listed in Table 3 and further described at Section 11.5.

---

\(^2\) See Part 1 of Schedule 8 to the Rules.

\(^3\) Unless more than one fuel is used to generate electricity or the Generating Unit has installed CCUS technology and intends to discount captured emissions by applying the Fossil Fuel Emissions CCUS Formula.
Table 3 – Formulae to calculate Fossil Fuel Emissions of a Generating Unit

<table>
<thead>
<tr>
<th>Formula Name</th>
<th>When the formula is applied</th>
<th>Formula</th>
<th>Further Guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fossil Fuel Emissions Formula</td>
<td>Standard formula to be applied to a Generating Unit that uses one fuel to produce electricity and the person does not intend to apply the Fossil Fuel Emissions CCUS Formula.</td>
<td>[ FFE = \frac{0.0036 \times EF_{f,CO2}}{\eta_{des}} = \frac{gCO_2}{kWh_e} ]</td>
<td>See Section 11.1.</td>
</tr>
<tr>
<td>Fossil Fuel Emissions CCUS Formula</td>
<td>May be applied if the Generating Unit is equipped with CCUS technology and uses one fuel to produce electricity.</td>
<td>[ FFE = \frac{0.0036 \times (1 - TCF)EF_{f,CO2}}{\eta_{des}} = \frac{gCO_2}{kWh_e} ]</td>
<td>See Section 11.4.</td>
</tr>
<tr>
<td>Fossil Fuel Emissions Mixed Fuel Formula</td>
<td>Must be applied if the Generating Unit uses more than one fuel to produce electricity, unless the person chooses to apply the Fossil Fuel Emissions Composite Formula.</td>
<td>[ FFE = \frac{0.0036 \times EF_w}{\eta_{des}} = \frac{gCO_2}{kWh_e} ]</td>
<td>See Section 11.5.1.</td>
</tr>
<tr>
<td>Fossil Fuel Emissions Composite Formula</td>
<td>May be applied if the Generating Unit uses more than one fuel to produce electricity and is equipped with CCUS equipment.</td>
<td>[ FFE = \frac{0.0036 \times (1 - TCF)EF_w}{\eta_{des}} = \frac{gCO_2}{kWh_e} ]</td>
<td>See Section 11.5.2.</td>
</tr>
</tbody>
</table>

For the formulae listed in Table 3:

- The weighted emissions factors, “\( EF_w \)”, is determined by applying the relevant corresponding formula in Part 5.2 of Schedule 8.
- The Design Efficiency, \( \eta_{des} \), is determined using the formulae described in Part 3.2 in Schedule 8 of the Rules and is discussed in further detail in sections 11.2 and 11.3 of this document.

Alongside the Fossil Fuel Emissions Declaration, as per the requirements in Part 6 of Exhibit ZA, you will need to submit, in respect of each component declared in Part 3 of Exhibit ZA, evidence of:

a) the data used to calculate the values of the variables used to determine Design Efficiency (\( \eta_{des} \)) of the relevant Fossil Fuel Component (for example from a power plant commissioning contract, the power plant testing that is deemed to be most representative of the plant’s normal operation, or equivalent information from other technical sources);

---

84 See Part 1 of Schedule 8 to the Rules. Note that only the standard Fossil Fuel Emissions Formula is available to CMUs which were awarded capacity agreements in the early 2021 capacity auctions.
b) a description (including title and year) of the ISO (International Organisation for Standardisation) or EN (European Standards) standard/s applied, if any, (for example from the power plant commissioning contract, the most recent power plant testing);

c) confirmation of which fuel is used by the Fossil Fuel Component and therefore used to determine the appropriate Emission Factor (“EF_f,CO2”); and

d) details of any assumptions made in the calculation of Fossil Fuel Emissions

e) a copy of the Qualifying CHPQA Certificate used (if applied).

11.2 Calculation of the Design Efficiency for components other than CHP components

The Design Efficiency ("η_des") of a Generating Unit\(^85\) is a value expressed as a percentage, determined in accordance with the following formula\(^86\):

\[
η_{des} = \frac{W_E}{\text{Consumption Rate} \times NCV} = [\%]
\]

Note the following when determining Design Efficiency in accordance with the formula in Schedule 8 Part 3.2(a):

- The Net Calorific Value (NCV) should be taken from the table at Schedule 9 of the Rules based on the fuel used by the Generating Unit. You must determine the value of \(W_E\) in relation to the Generating Unit as the maximum electrical output of the Generating Unit expressed in MW.
- The Consumption Rate must be determined in relation to the Generating Unit and is the consumption rate of fuel used by the Generating Unit at maximum electrical output, in kilograms per second.
- Variables may be determined through recent power plant testing, a power plant commissioning contract, or equivalent information from other technical sources as appropriate.
- Where multiple values are available, the value that is deemed to be most representative of the Generating Unit’s normal operation should be used.

11.3 Calculation of the Design Efficiency for CHP components

This section describes the Design Efficiency Formula that a person may choose to apply in respect of a Generating Unit in the CHP Generating Technology Class awarded a capacity agreement after the coming into force of the Capacity Market (Amendment) Rules 2021\(^87\).

11.3.1. The Design Efficiency CHPQA Formula

In order to apply the Design Efficiency CHPQA Formula, CHP installations must be covered by a CHP Quality Assurance (CHPQA) Certificate. These certificates are provided to installations as part of the CHPQA Programme, a government initiative that provides a comprehensive methodology for evaluating the quality of CHP schemes. CHPs that are not covered by a CHPQA certification will still be able to

---

\(^85\) Other than a Generating unit which is in the Combined Heat and Power (CHP) Generating Technology Class intends to apply the Design Efficiency CHPQA Formula or the Design Efficiency Steam Formula.

\(^86\) See section 1 of Part 3 of Schedule 8 to the Rules.

\(^87\) CMUs awarded a capacity agreement in the early 2021 auction may instead choose to apply the Design Efficiency Steam Formula. See para 3.1(b) of Part 3 of Schedule 8 to the Rules.
Carbon Emissions Limits in the Capacity Market

participate in the CM but will need to apply the formulae developed for non-CHP plant detailed in Section 11.2.\textsuperscript{88}

The Design Efficiency ("\(\eta_{des}\)) is a value expressed as a percentage, determined in accordance with the following formula\textsuperscript{89}:

\[
\eta_{des} = \frac{TPO}{TFI \times Cf \times F_e} = [%]
\]

The total power output (TPO), total fuel input (TFI) and percentage of fuel referable to electricity generation (\(F_e\)) of the Generating Unit are values determined under the CHPQA Programme and are specified on a CHPQA Certificate for that unit. The TPO, TFI are all expressed in MWh while \(F_e\) is expressed as a percentage. The conversion factor (\(Cf\)) value corresponds to the type of fuel used by the Generating Unit and is specified in Schedule 9 of the Rules. The purpose of the conversion factor is to convert the TFI, which is calculated on a Gross Calorific Value basis, into a figure calculated on a Net Calorific Value basis, in coherence with how emissions are calculated for other technologies.

11.3.2. The CHPQA Certificate

When taking values from the CHPQA certificate, you should consider that a ‘scheme’ on the certificate corresponds to a CMU component (i.e. a Generating Unit). Where there is the possibility for you to arrange your Generating Units into a CHP schemes for the purposes of CHPQA certification, this should be done bearing this in mind.

11.3.3. The Design Efficiency Steam Formula

For CMUs awarded a Capacity Obligation in an auction before the Capacity Market (Amendment) Rules 2021 came into force, relating to units who prequalified in 2020, the following Design Efficiency Steam Formula applies:

\[
\eta_{des} = \frac{W_E + Q W_T}{Consumption\ Rate \times NCV} = [%]
\]

You must determine \(Q\) in relation to the Generating Unit as the efficiency of the turbine comprised in the Generating Unit that is outputting steam, expressed as a percentage. The power extracted by expanding the output steam (\(W_T\)) must be determined using Part 4 of Schedule 8 to the Rules.

As provided in Part 4 of Schedule 8 to the Rules, a CHP installation may assume the value of \(W_T\) to be zero\textsuperscript{90}. For example, where you determine \(W_T\) cannot be determined by applying the formula in paragraph (b) of Part 4 because each value would have a negligible value. Other examples are where CHP installations do not have a turbine that is outputting steam or are otherwise unable to determine \(Q\) or \(W_T\). By taking \(W_T\) to be zero, the value of "\(Q W_T\)" is zero so CMUs in the Combined Heat and Power (CHP) Generating Technology Class are effectively applying a formula equivalent to the formula for Generating Units not in the Combined Heat and Power (CHP) Generating Technology Class.

\textsuperscript{88} See Part 3.1 of Schedule 8 of the Rules.
\textsuperscript{89} See also section 2 of Part 3 of Schedule 8 to the Rules.
\textsuperscript{90} See paragraph (a) of Part 4 of Schedule 8 to the Rules.
11.4 The Fossil Fuel Emissions CCUS Formula – For Carbon Capture, Utilisation and Storage (CCUS)

When calculating the Fossil Fuel Emissions of a generating unit equipped with CCUS technology you may choose to discount the average percentage of carbon dioxide captured per kWh of electricity produced. For components using only one fossil fuel to generate electricity, this can be done by calculating the Generating Unit’s FFE through the Fossil Fuel Emissions CCUS Formula in Schedule 8, Part 1.2 (b) of the Rules.

\[
FFE = \frac{0.0036 \times (1 - TCF)EF_{f,CO_2}}{\eta_{des}} = \left[ \frac{gCO_2}{kWh_d} \right]
\]

To do this, you must calculate a ‘transferred CO2 factor’ (TCF), defined as the percentage of CO2 captured and transferred out of the total CO2 generated by the generating unit across an ‘Emissions Year’. The period of time which an Emissions Year relates to depends on the deadline in respect of which a Fossil Fuel Emissions Declaration is provided.\(^9\) For example, if a Fossil Fuel Emissions Declaration is provided with an Application, it means any continuous period of 12 months within the 14 months preceding the opening of Prequalification window for that year.

The TCF must be calculated in accordance with the formulae set out in Schedule 8, Part 4.1. It is made up of two components: \(CO_2\)\(_{generated}\) and \(CO_2\)\(_{transferred}\).

\(CO_2\)\(_{generated}\) must be calculated in accordance with the formula in Schedule 8, Part 7.2(a):

\[
CO_2\)\(_{generated} = TFEI \times EF_{f,CO_2} \times 0.0036 = [kgC_2O_2]
\]

\(CO_2\)\(_{transferred}\) is the CO2 captured and transferred by the generating unit over an Emissions Year (in kg). Note the following:

- Any metering method is accepted, provided that it is accurate to \(\pm 2.5\%\).
- Captured CO2 may be included in the calculation of \(CO_2\)\(_{transferred}\) regardless of the end use, provided it is not simply released into the atmosphere after capture. CO2 that is simply released after capture does not count as captured CO2 and a plant that releases all its captured CO2 will not be able to calculate TCF or use the Fossil Fuel Emissions CCUS Formula.

Once these two components have been calculated, TCF can be calculated in line with the formula in Schedule 8, Part 4.1:

\[
TCF = \frac{CO_2\)\(_{transferred}}{CO_2\)\(_{generated}} = [%]
\]

Once TCF has been calculated, Fossil Fuel Emissions must be determined in line with the Fossil Fuel Emissions CCUS Formula, which is located in Schedule 8, Part 1.2(b) of the Rules.

11.4.1. CCUS and CHP

You may opt to apply both the CHP-specific Design Efficiency CHPQA Formula together with the Fossil Fuel Emissions CCUS Formula in respect of a Generating Unit that is in the CHP Generating

---

\(^9\) See the definition of ‘Emissions Year’ in Rule 1.2.1.
Technology Class and that is equipped with CCUS technology. This will involve calculating Design Efficiency based on the fuel used for electricity generation only, using values taken from a Qualifying CHPQA Certificate, as described in Section 11.3. Simultaneously, the average percentage of CO2 captured and transferred per kWh of electricity generated will be discounted from FFE calculations by using the new Fossil Fuel Emissions CCUS Formula described above in Section 11.4. This will involve calculating $CO_{2\text{transferred}}$, defined as the total quantity of CO2 captured and transferred by the generating unit over a continuous 12-month period.

In the absence of further adjustments, however, applying the Fossil Fuel Emissions CCUS Formula alongside the Design Efficiency CHPQA Formula in respect of a unit in the CHP Generating Technology Class would create an undue advantage: declared fossil fuel emissions would be those resulting from electricity generation only, while $CO_{2\text{transferred}}$ would reflect avoided CO2 emissions from production of both electricity and heat. Essentially, this would amount to 'inflating' the quantity of CO2 captured relative to the quantity of electricity generated.

To correct this, you must calculate $T\text{CF}$ with no adjustment made to use only the percentage of fuel referrable to electricity. In other words, when calculating $CO_{2\text{generated}}$ in line with the formula in Schedule 8, Part 7.2(a), TFEI is the total fuel input during the relevant 12-month period (comprising fuel used to produce heat as well as fuel used to produce electricity).

### 11.5 Fossil Fuel Components using more than one Fossil Fuel

A Fossil Fuel Emissions Declaration submitted in relation to a Fossil Fuel Component that burns more than one fuel to produce electricity must specify all types of fuels used to produce electricity and will be required to account for emissions from all fossil fuels burned, rather than the primary fuel only. The type/s of fuels used should be specified under ‘Generating Unit Fuel Type/s’ and the emissions for the component under ‘Fossil Fuel Emissions’ and ‘Fossil Fuel Yearly Emissions’ (where appropriate) in the table in Part 3 of Exhibit ZA. Note the following if your component uses more than one fuel to produce electricity:

- When calculating the emissions, if one of the fuels used is not a fossil fuel (e.g. biofuels) then the Emission Factor for that fuel is 0.
- Any fuel used solely for the purpose of starting the combustion process of a Generating Unit should not be taken into account as, under the definition of ‘Fossil Fuel Component’ in the Rules, it is the fuel used to produce electricity which is relevant.

#### 11.5.1. The Fossil Fuel Emissions Mixed Fuel Formula

Generating Units burning more than one fuel92 to produce electricity will be required to account for emissions from all fuels burned, rather than the primary fuel only.93 You must therefore use the Fossil Fuel Emissions Mixed Fuel Formula in in Schedule 8, Part 1.2(c):

$$ FFE = \frac{0.0036 \times EF_W}{\eta_{des}} = \frac{gCO_2}{kWh_{ele}} $$

If you are making use of the Fossil Fuel Emissions Mixed Fuel Formula, you will need to calculate a weighted emission factor ($EF_W$) that accounts for the proportion and carbon content of each fuel burned. The relevant formula is set out in Schedule 8, Part 5.1(a) of the Rules:

---

92 Where at least one fuel is a Fossil Fuel.
93 Not applicable to agreements awarded in the early 2021 capacity auctions.
Carbon Emissions Limits in the Capacity Market

\[ EF_W = (FS_{F_1} \times EF_{F_1}) + (FS_{F_2} \times EF_{F_2}) + \cdots + (FS_{F_n} \times EF_{F_n}) = \left[ \frac{kg \, CO_2}{TJ} \right] \]

Where the product of the share of each fuel burned to produce electricity, \( FS \), and its standard Emission Factor, \( EF \), are combined to enable a more accurate reflection of the Fossil Fuel Emissions of a plant using mixed fuels. The fuel share, \( FS \), is calculated using the relevant formula as set out in Schedule 8, Part 8.1 of the Rules:

\[ FS_i = \frac{Q_{F_i} \times NCV_{F_i}}{(Q_{F_1} \times NCV_{F_1}) + (Q_{F_2} \times NCV_{F_2}) + \cdots + (Q_{F_n} \times NCV_{F_n})} = [%] \]

Where \( F_i \) is the fuel for which the FS is being calculated, \( F_1 \) is the primary fuel, \( F_2 \) is the secondary fuel and \( F_n \) is any other fuel that is part of the fuel mix to be considered individually. The energy input of each fuel is calculated by multiplying the quantity of fuel, \( Q \) (in Gigagrams, Gg) by the Net Calorific Value (NCV) of the fuel (as specified in Schedule 9 of the Rules).

11.5.2 The Fossil Fuel Emissions Composite Formula

When preparing an application in respect of a Generating Unit burning more than one fuel and that is equipped with CCUS technology, you may opt to make use of the CCUS-specific formulae by applying the Fossil Fuel Emissions Composite Formula, set out in Schedule 8, Part 1.2(d), to calculate emissions:

\[ FFE = \frac{0.0036 \times (1 - TCF)EF_W}{n_{des}} = \left[ gCO_2 \times kWh_e \right] \]

You must calculate \( EF_W \) following the equations described in Section 11.5.1. Next, you should use \( EF_W \) in calculating \( CO2_{generated} \). The formula for doing this is set out in Schedule 8, Part 7.2(b) of the Rules:

\[ CO2_{generated} = TFEI \times EF_W \times 0.0036 = [kg \, CO_2] \]

Once \( CO2_{generated} \) has been calculated, you can determine the appropriate \( TCF \) value using the formula described in Schedule 8, Part 4.1 and Section 11.4 of this document.

11.5.3 Plant burning mixed fuels and CHP

In respect of a Generating Unit using more than one fuel to produce electricity, you must apply the Fossil Fuel Emissions Mixed Fuel Formula to determine FFE. If the same Generating Unit is in the CHP Generating Technology Class, you may also opt to use the Design Efficiency CHPQA Formula in Schedule 8, Part 3.2(c) to calculate the Generating Unit’s design efficiency for use in the Fossil Fuel Emissions Mixed Fuel Formula that is set out in Schedule 8, Part 1.2(c).

When calculating \( EF_W \), you should apply the formula set out in Schedule 8, Part 5.1(b), which pertains specifically to Generating Units that burn more than one fuel to produce electricity and that have also opted to apply the Design Efficiency CHPQA Formula. The formula brings together the new formulae pertaining to both units burning mixed fuels and units in the CHP Generating Technology Class. It

\[ 94 \text{ Note that holding a CHPQA certificate is a prerequisite to applying this formula as it relies on values in the certificate. A CHP installation burning mixed fuels that does not hold a CHPQA certificate will have to apply the Fossil Fuel Emissions Formula in Schedule 8, Part 1.2(a) in the same way as a plant not in the CHP Generating Technology Class.} \]
produces a weighted emission factor that accounts for the not only for the percentage of the total fuel input referable to electricity generation, but also for the percentage by which each different fuel contributes to the fuel mix:

\[ EF_W = \frac{(Q_{F1} \times Q_{E1} \times EF_{P1}) + (Q_{F2} \times Q_{E2} \times EF_{P2}) + \ldots + (Q_{Fn} \times Q_{En} \times EF_{Pn})}{TFI \times F_e} \]

Data to be used in this formula, which are not found on the CHPQA certificate, need to be drawn from an Emissions Year, in line with the approach for plant burning mixed fuels.

Once \( EF_W \) has been calculated, you should apply the Design Efficiency CHPQA Formula in Schedule 8, Part 3.2(c). You then apply the Fossil Fuel Emissions Composite Formula set out in Schedule 8, Part 1.2(d).

### 11.5.4 Mixed fuels, CHP and CCUS

In respect of a Generating Unit burning more than one fuel to produce electricity, that is in the CHP Generating Technology Class and that is equipped with CCUS technology, you may apply the Fossil Fuel Emissions Composite Formula described in Section 11.5.2 of this document instead of the Fossil Fuel Emissions Mixed Fuel Formula, and may also choose to apply the Design Efficiency CHPQA Formula described in Section 11.3.

The Fossil Fuel Emissions Composite Formula is set out in Schedule 8, Part 1.2(d):

\[ FFE = \frac{0.0036 \times (1 - TCF)EF_W}{\eta_{des}} \quad [\text{gCO}_2 \text{kgWh}_e] \]

You should first calculate a weighted emission factor \( EF_W \) in line with the standard formula set out in Schedule 8, Part 5.2(a). This \( EF_W \) should be used in calculating \( CO_2 \) generated in accordance with the formula in Schedule 8, Part 7.2(b) of the Rules and the corresponding \( TCF \). Please note that the standard formula at 5.2(a) should be used when calculating the \( EF_W \) that is then used to calculate \( TCF \). This is to ensure that the whole fuel intake of the plant is taken into account, including the fuel that goes towards heat production. This ensures that the amount of CO2 captured is not 'inflated' relative to the quantity of electricity produced.

Next, you should calculate a CHP-specific \( EF_W \) of fuel referable to electricity generation only in line with the formula in Schedule 8, Part 5.2(b). Using this \( EF_W \), the generating unit should next calculate Fossil Fuel Emissions in accordance with the Fossil Fuel Emissions Composite Formula which is found in Schedule 8, Part 1.2(d).

Note that Design Efficiency should be calculated in line with the Design Efficiency CHPQA formula, which can be found in Schedule 8, Part 3.2(c).

We acknowledge that applying these sets of formulae in this way will involve using data from up to three different continuous 12-month periods.
11.6. Plants applying CCUS, CHP and Mixed Fuel formulae without 12 months of data

The new Fossil Fuel Emissions CCUS Formula, Fossil Fuel Emissions Mixed Fuel Formula, Fossil Fuel Emissions Composite Formula and Design Efficiency CHPQA Formula, introduced as part of the Capacity Market (Amendment) Rules 2021 require data over an Emissions Year in order to be calculated, i.e. a continuous 12-month period.

It may be that, in respect of an Existing Generating or Proven DSR CMU, you do not have 12 months of emissions data at Prequalification because the installation work for the relevant units has been completed less than 12 months before the date of submission of your application, or because the unit is not complete, or because it has not yet started commercial production yet. If you wish to apply one of these formulae but do not have 12 continuous months of data available, the Rules account for this in the deadline by which a Fossil Fuel Emissions Declaration is required.

For example, the deadlines for submitting a Fossil Fuel Emissions Declaration in accordance with Rule 8.3.12A(b) are:

- 14 months after the date the agreement takes effect for CMUs applying the Fossil Fuel Emissions CCUS Formula, the Fossil Fuel Emissions Mixed Fuel Formula or the Fossil Fuel Emissions Composite Formula (but not the Design Efficiency CHPQA Formula).

- The last day of August following a CHPQA Delivery Year for CMUs applying the Design Efficiency CHPQA Formula (even where they also apply the Fossil Fuel Emissions CCUS Formula, the Fossil Fuel Emissions Mixed Fuel Formula or the Fossil Fuel Emissions Composite Formula).

You will need to make the relevant confirmation via the Delivery Body portal, as set out in Rule 3.6.5A(b) or Rule 3.9.5A(b). This is to ensure that no special extension for the submission of the Fossil Fuel Emissions Declaration is granted if you would be compliant by applying other formulae available to it, for which you have the relevant data.

It is therefore essential that, prior to applying for Prequalification, you calculate Fossil Fuel Emissions of a relevant Fossil Fuel Component (i.e. using the standard Fossil Fuel Emissions Formula) using data already available to check if it would be compliant with the Fossil Fuel Emissions Limit without the use of additional formulae for which you lack 12 months of data. This does not apply to components burning mixed fuels without 12 months of data, which will be able to benefit from the extension irrespective of whether they would be compliant or not without applying the relevant formulae.

Where the full 12 months data becomes available during the Prequalification Window, we encourage you to submit your application once you have the data so that you are able to provide a full Fossil Fuel Emissions Declaration with the application. However this might not be possible or advisable when the full 12 months of data become available only shortly before the end of the Prequalification Window, given the timescales required for the Declaration being prepared and, where required\(^{95}\), independently verified. In these situations, you should aim to submit your application before the 12 months of data becomes available, and state in your application that you do not have 12 months of data available to make the requisite calculations. Please take care to avoid unintentionally making a false declaration by submitting your application where you declare you don’t have 12 months of data after the 12 months of data would have been available.

\(^{95}\) i.e. In respect of a Fossil Fuel Emissions Declaration which is not a Transitional Fossil Fuel Emissions Declaration and contains at least one relevant Fossil Fuel Component with an Installed Capacity equal to or greater than 1MW.
When applying one or more formulae that require data from more than one continuous 12 months period, you are encouraged to use the same 12 months period where possible. It is however possible to use different 12 months period, so long as compliance with the appropriate deadlines (in most cases, a continuous 12-month period within the 14 months preceding the submission of the Fossil Fuel Emissions Declaration) is respected.

The Delivery Body checks that a Fossil Fuel Emissions Declaration is validly completed. A Fossil Fuel Emissions Declaration that is submitted more than 2 months after the date it has been verified by an Independent Emissions Verifier may not be accepted as it would indicate the 12 continuous months of data fall outside of an Emissions Year.

11.7 The Emission Factor of Fossil Fuels not listed in Schedule 9 of the Rules

The table in Schedule 9 of the Rules lists the Emission Factors that Fossil Fuels must use when applying the formulae in Schedule 8 of the Rules to calculate their emissions. The formulae requiring an Emission Factor include the Fossil Fuel Emissions Formula and Fossil Fuel Emissions CCUS Formula\(^96\), the formulae to determine weighted emissions factors\(^97\) and the formula to determine \(C02_{\text{generated}}\)\(^98\).

The table in Schedule 9 was integrated into the Rules to reflect guidance provided when carbon emissions limits were implemented prior to EU Exit\(^99\) and should therefore reflect the fuels used by Generating Units participating in the CM.

Where a fuel used by your Generating Unit is not named in the table, you should first consider whether the fuel is a Fossil Fuel according to the definition in Rule 1.2:

“Fossil Fuel means:

(a) coal;
(b) lignite;
(c) peat;
(d) natural gas (within the meaning of section 21 of the Energy Act 1976);
(e) crude liquid petroleum;
(f) bitumen;
(g) any substance which—

(i) is produced directly or indirectly from a substance mentioned in paragraphs (a) to (f) for use as a fuel for a Generating Unit; and

(ii) when burned, produces a greenhouse gas (within the meaning of section 92 of the Climate Change Act 2008)”

---

\(^96\) See Part 1 of Schedule 8 of the Rules.
\(^97\) See Part 5 of Schedule 8 of the Rules.
\(^98\) See Part 4 of Schedule 8 of the Rules.
Fuels that clearly do not fall within this definition, such as biogas and biomass, should apply an Emission Factor of 0 where required (for example when applying the formula to determine the weighted emission factor of a plant burning mixed fuels, where the other fuel/s in the mix are Fossil Fuels).

If your Generating Unit uses a Fossil Fuel which is not named in Schedule 9 but you consider falls within the definition of Fossil Fuel set out above, please contact the Energy Security policy team on energy.security@beis.gov.uk for advice on the approach to apply.

11.8 Fossil Fuel Yearly Emissions

In respect of the Delivery Year in 2024/25 and subsequent Delivery Years, a relevant Fossil Fuel Component with a Commercial Production Start Date before 4 July 2019 that does not comply with the Fossil Fuel Emissions Limit, may participate in the CM if a Fossil Fuel Emissions Declaration demonstrates that it complies with the Fossil Fuel Yearly Emissions Limit.

The Fossil Fuel Yearly Emissions (“FFYE”) of a Generating Unit determined in accordance with the following formula:

\[
\text{FFYE} = \left( \frac{\text{FFE} \times \text{Electricity Production}}{\text{Installed Capacity}} \right) \left( \frac{\text{kg CO}_2}{\text{kWe}} \right)
\]

This calculation requires application of the Fossil Fuel Emissions calculated in respect of the Generating Unit in accordance with Part 1 of Schedule 8 to the Rules. You must determine the value of the Electricity Production of a Generating Unit over an ‘Emissions Year’.

Note that the period of time which an Emissions Year relates to depends on the deadline in respect of which a Fossil Fuel Emissions Declaration is provided. For example, if a Fossil Fuel Emissions Declaration is provided with an Application, it means any continuous period of 12 months within the 14 months preceding the opening of Prequalification window for that year.

Compliance over this period demonstrates the ability of the CMU to operate within the Fossil Fuel Yearly Emissions Limit. By submitting a Fossil Fuel Emissions Declaration which specifies the Fossil Fuel Yearly Emissions of a component, a CM participant will also be required to operate within this limit during the relevant Delivery Year, in the event it secures a Capacity Agreement for that Delivery Year.

Alongside the Fossil Fuel Emissions Declaration, as per the requirements in Part 6 of Exhibit ZA, you will need to submit, in respect of each component declared in Part 3 of the Fossil Fuel Emissions Declaration, evidence of the data used to calculate the Electricity Production for each relevant Fossil Fuel Component (for example from a verified metering system, or TSO/DSO metering).

---

100 An Existing Generating CMU or a Proven DSR CMU which comprises of a component which exceeds both the Fossil Fuel Emissions Limit and the Fossil Fuel Yearly Emissions Limit will not Prequalify to participate in the CM (See Rule 4.4.2(k)(ii)). A New Build, Refurbishing CMU or Unproven CMU which comprises of a component with a Commercial Production Start Date before 4 July 2019 which exceed both the Fossil Fuel Emissions Limit and the Fossil Fuel Yearly Emissions Limit will breach the declaration made in a Fossil Fuel Emissions Commitment and Rule 8.3.14(b)(ii)(bb) provides that the Termination Event in Rule 6.10.1(o) will be applicable.

101 See Part 2 of Schedule 8 to the Rules.

102 The electricity exported (as defined in Regulation 2 of the Electricity Capacity Regulations 2014) into the Total System by the Generating Unit in an Emissions Year, expressed in GWh (See Part 2 of Schedule 8 to the Rules).

103 See the definition of ‘Emissions Year’ in Rule 1.2.1.

104 See Rule 3.4.11.
## Carbon Emissions Limits in the Capacity Market

Annex B – Worked Examples

The following worked examples demonstrate, for illustrative purposes only, how to compute Fossil Fuel Emissions in a variety of circumstances. You should consider Schedule 8 of the Rules carefully before making an application for Prequalification and seek expert advice on any calculations which you make when determining carbon emissions for inclusion in a Fossil Fuel Emissions Declaration, as this document provides a summary only.

2.1 A Generating Unit using one fuel (no CCUS, no CHP)

This example considers an OCGT unit combusting natural gas to produce electricity (“Generating Unit A”). No CCUS equipment is included in Generating Unit A, and no heat is used elsewhere (i.e. the unit is not in the CHP Generating Technology Class). Table A on the following page shows the data required to perform the calculations, including the source to be used for each data item.

Table A– Data required to perform calculations for Generating Unit A (no CCUS, no CHP)

<table>
<thead>
<tr>
<th>Data</th>
<th>Description</th>
<th>Example Value</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generating Unit Fuel Type</td>
<td>Fuel type used by the Generating Unit</td>

<td>48.0 GWh</td>
<td>Plant operator</td>
</tr>
<tr>
<td>Installed Capacity</td>
<td>Nominal electrical capacity of the Generating Unit</td>
<td>100 MW</td>
<td>Plant specifications</td>
</tr>
</tbody>
</table>

Design Efficiency

First the Design Efficiency (“\(\eta_{des}\)”) of Generating Unit A must be calculated. This value represents the efficiency of the plant at maximum output and is calculated as follows, using the equation in Schedule 8, Part 3.2(a):
\[ \eta_{des} = \frac{W_E}{\text{Consumption Rate} \times NCV} = \frac{100 \text{ MW}}{5.96 \frac{kg}{s} \times 48.0 \frac{TJ}{g}} = 0.350 = 35.0\% \]

\[ \eta_{des} = \frac{W_E}{\text{Consumption Rate} \times NCV} = \frac{100 \text{ MW}}{5.96 \frac{kg}{s} \times 48.0 \frac{TJ}{g}} = 0.350 = 35.0\% \]

Where the values \( W_E \), Consumption Rate, and \( NCV \) are as described in Table A.

### Fossil Fuel Emissions

The Fossil Fuel Emissions (“FFE”) of Generating Unit A per unit of electricity generated is then calculated based on the plant’s design efficiency (\( \eta_{des} \)) and the Emissions Factor of the fuel being used. This is calculated using the equation in Schedule 8, Part 1.2(a) as follows:

\[
FFE = \frac{0.0036 \times EF_{f,CO_2}}{\eta_{des}} = \frac{0.0036 \times 56100}{0.350} \frac{kg CO_2}{TJ} = 577.0 \frac{g CO_2}{kWh_e}
\]

Where \( EF_{f,CO_2} \) is as described in Table A.

577gCO\(_2\)/kWh\(_e\) of Fossil Fuel Emissions exceeds Fossil Fuel Emissions Limit of 550 gCO\(_2\)/kWh\(_e\), so the Generating Unit is not compliant. However, if Generating Unit A started commercial production before July 4th 2019, it may still be able to participate in the CM if it complies with the Fossil Fuel Yearly Emissions Limit, as described below.

### Fossil Fuel Yearly Emissions

The Fossil Fuel Yearly Emissions (“FFYE”) of Generating Unit A are calculated from the Fossil Fuel Emissions (“FFE”), the annual Electricity Production of the Generating Unit, and its nominal Installed Capacity. The is calculated using the equation in Schedule 8, Part 2.1 as follows:

\[
FFYE = \frac{FFE \times \text{Electricity Production}}{\text{Installed Capacity}} = \frac{577.0 \frac{g CO_2}{kWh_e} \times 48.0 \text{ GWh}}{100 \text{ MW}} = 277.0 \frac{kg CO_2}{kWe}
\]

Where the values Electricity Production and Installed Capacity are defined in Table A.

277 kgCO\(_2\)/kWe value of Fossil Fuel Yearly Emissions is below the Fossil Fuel Yearly Emissions Limit of 350 kgCO\(_2\)/kWe.

### 2.2 A Generating Unit using one fuel and equipped with CCUS

This example considers a CCGT unit combusting natural gas to produce electricity (“Generating Unit B”). Generating Unit B is equipped with CCUS technology, with the CO\(_2\) being transferred elsewhere for utilisation. No heat from the plant is used elsewhere (i.e. the unit is not in the CHP Generating Technology Class). Table B shows the data required to perform the calculations, including the source to be used for each data item.
Table B – Data required to perform calculations for Generating Unit B

<table>
<thead>
<tr>
<th>Data</th>
<th>Description</th>
<th>Example Value</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fuel type</td>
<td>Fuel type consumed by Generating Unit B</td>
<td>Natural Gas</td>
<td>Plant specifications</td>
</tr>
<tr>
<td>NCV</td>
<td>Net Calorific Value of fuel</td>
<td>48.0 TJ/Gg</td>
<td>Schedule 9</td>
</tr>
<tr>
<td>Consumption Rate</td>
<td>Consumption rate of fuel by Generating B Unit at maximum electrical output</td>
<td>21.72 kg/s</td>
<td>Plant operator</td>
</tr>
<tr>
<td>$W_E$</td>
<td>Maximum electrical output of Generating Unit B</td>
<td>490 MW</td>
<td>Plant operator</td>
</tr>
<tr>
<td>$EF_{f,CO2}$</td>
<td>Emission Factor of the fuel</td>
<td>56100 kgCO$_2$/TJ</td>
<td>Schedule 9</td>
</tr>
<tr>
<td>$CO_2_{\text{transferred}}$</td>
<td>Total CO$_2$ captured and transferred by Generating Unit B over an Emissions Year</td>
<td>138000000 kgCO$_2$</td>
<td>Plant operator</td>
</tr>
<tr>
<td>$TFEI$</td>
<td>Total fuel combusted to generate electricity over the same Emissions Year used for $CO_2_{\text{transferred}}$</td>
<td>990426 MWh</td>
<td>Plant operator</td>
</tr>
</tbody>
</table>

Design efficiency

First the Design Efficiency (“$\eta_{des}$”) of Generating Unit B must be calculated. This value represents the efficiency of the plant at maximum output and is calculated as follows, using the equation in Schedule 8, Part 3.2(a):

$$
\eta_{des} = \frac{W_E}{Consumption\ Rate \times NCV} = \frac{490\ MW}{\frac{21.72\ kg}{s} \times \frac{48.0\ TJ}{Gg}} = 0.470 = 47.0\% 
$$

Where the values $W_E$, Consumption Rate, and NCV are defined in Table B.

Transferred CO$_2$

As Generating Unit B is equipped with CCUS technology, the CCUS formulae can be applied. First, the total CO$_2$ emissions generated by the Generating Unit in one year is calculated based on the total fuel consumption (“$TFEI$”) and the fuel’s Emission Factor (“$EF_{f,CO2}$”). The calculation is performed as follows, using the equation in Schedule 8, Part 7.2(a):
Carbon Emissions Limits in the Capacity Market

\[ \text{CO}_2_{generated} = \frac{\text{TFEI} \times EF_{f,CO2} \times 0.0036}{TJ} = \frac{\text{990426 MWh} \times 56100 \frac{kg CO}_2}{TJ} \times 0.0036}{200026435 kg CO}_2 \]

Where TFEI and EF_{f,CO2} are defined in Table B.

Then the Transferred CO\(_2\) Factor ("TCF") can be calculated. This uses \( \text{CO}_2_{generated} \) as calculated above, as well as the total CO\(_2\) captured at the Generating Unit and transferred elsewhere ("CO\(_2\)\text{transferred}\"), measured over the same year for which TFEI was measured. The calculation is as follows, using the equation in Schedule 8, Part 4.1:

\[ TCF = \frac{\text{CO}_2\text{transferred}}{\text{CO}_2\text{generated}} = \frac{138000000 \text{ kg CO}_2}{200026435 \text{ kg CO}_2} = 0.690 = 69.0\% \]

Where \( \text{CO}_2\text{transferred} \) is defined in Table B.

**Fossil Fuel Emissions**

The Fossil Fuel Emissions ("FFE") of Generating Unit B per unit of electricity generated is then calculated based on Generating Unit B’s design efficiency ("\( \eta_{des} \"\), the Emission Factor of the fuel being used, and the Transferred CO\(_2\) factor ("TCF") This is calculated using the equation in Schedule 8, Part 1.2(b) as follows:

\[ FFE = \frac{0.0036 \times (1 - TCF) EF_{f,CO2}}{\eta_{des}} = \frac{0.0036 \times (1 - 0.690) \times 56100 \frac{kg CO}_2}{TJ} \times \frac{0.470}{133.2 \frac{g CO}_2}{kWhe} \]

133.2 gCO\(_2\)/kWh\(_e\) is below the Fossil Fuel Emissions Limit of 550 gCO\(_2\)/kWh\(_e\), so Generating Unit B is eligible to apply to participate in the Capacity Market.

**2.3 A Generating Unit using one fuel applying a CHP formula**

This example considers a reciprocating diesel engine operating in CHP mode (i.e. both electricity and heat are exported by the plant) ("Generating Unit C\") Generating Unit C is not equipped with CCUS technology. Generating Unit C is covered by a Qualifying CHPQA certificate, which is used to support the calculations. Table C shows the data required to perform the calculations, including the source to be used for each data item.

**Table C – Data required to perform calculations for Generating Unit C**

<td>Schedule 9</td>
</tr>
</tbody>
</table>

#### Design efficiency

First the Design Efficiency ("\( \eta_{des} \)" ) of Generating Unit C must be calculated. This value represents the efficiency of the plant at maximum output. When applying the Design Efficiency CHPQA Formula, \( \eta_{des} \) is calculated using values specified on the CHPQA certificate. The equation is found in Schedule 8, Part 3.2(c):

\[
\eta_{des} = \frac{TPO}{TF1 \times C_f \times F_e} = \frac{5450 \text{ MWh}}{13010 \text{ MWh} \times 0.94 \times 0.545} = 0.818 = 81.8\%
\]

Where the values \( TPO, TF1, C_f, \) and \( F_e \) are defined in Table C.

#### Fossil Fuel Emissions

The Fossil Fuel Emissions ("FFE") of Generating Unit C per unit of electricity generated is then calculated based on its design efficiency ("\( \eta_{des} \)"") and the Emission Factor of the fuel being used. This is calculated using the equation in Schedule 8, Part 1.2(a) as follows:

\[
FFE = \frac{0.0036 \times EF_{f,CO2}}{\eta_{des}} = \frac{0.0036 \times 74100 \frac{kg CO_2}{TJ}}{0.818} = 326.1 \frac{g CO_2}{kWh_e}
\]

Where \( EF_{f,CO2} \) is defined in Table C.

326 gCO\(_2\)/kWh\(_e\) is below the Fossil Fuel Emissions Limit of 550 gCO\(_2\)/kWh\(_e\), the Generating Unit C is eligible to participate in the Capacity Market.
2.4 A Generating Unit using one fuel applying the CHP and equipped with CCUS

This example considers a coal-fired Generating Unit in the CHP Generating Technology Class (i.e. both electricity and heat are exported by the plant) (“Generating Unit D”). Generating Unit D is equipped with post-combustion CO₂ capture technology, and the captured CO₂ is transferred and utilised elsewhere. Generating Unit D is covered by a Qualifying CHPQA certificate, which is used to support the calculations. Table D shows the data required to perform the calculations, including the source to be used for each data item.

Table D – Data required to perform calculations for a plant with one fuel applying the CHP and CCUS formula

</tbody>
</table>
Design efficiency

First the Design Efficiency ("$\eta_{des}$") of Generating Unit D must be calculated. This value represents the efficiency of Generating Unit D at maximum output. When applying the Design Efficiency CHPQA Formula, $\eta_{des}$ is calculated using values specified on the CHPQA certificate. The equation is as follows, using the equation in Schedule 8, Part 3.2(c):

$$\eta_{des} = \frac{TPO}{TFI \times C_f \times F_e} = \frac{40390 \text{ MWh}}{175610 \text{ MWh} \times 0.95 \times 0.475} = 0.510 = 51.0\%$$

Where the values $TPO$, $TFI$, $C_f$, and $F_e$ are defined in Table D.

Transferred CO2

As Generating Unit D is equipped with CCUS technology, the CCUS formulae may be applied. First, the total CO2 emissions generated by the site in one year is calculated based on the total fuel consumption ("$TFEI$") and the fuel’s Emission Factor ("$EF_{f,CO2}$"). The calculation is performed as follows, using the equation in Schedule 8, Part 7.2(a):

$$C_{CO2}^{generated} = TFEI \times EF_{f,CO2} \times 0.0036$$

$$= \frac{72060 \text{ MWh} \times 98300 \text{ kgCO2} \times 0.0036}{25500592.8 \text{ kgCO2}}$$

Where $TFEI$ and $EF_{f,CO2}$ are defined in Table D. Note that the total fuel consumption $TFEI$ does not have to be measured over the same year as that used in the CHPQA certificate, and thus, as is the case in this example, $TFEI$ does not necessarily equal $TFI$.

Then the Transferred CO2 Factor ("$TCF$") can be calculated. This uses $C_{CO2}^{generated}$ as calculated above, as well as the total CO2 captured at Generating Unit D and transferred elsewhere ("$C_{CO2}^{transferred}$"). Note that, $C_{CO2}^{transferred}$ must be measured over the same year for which $TFEI$ was measured. The calculation is as follows, using the equation in Schedule 8, Part 4.1:

$$TCF = \frac{C_{CO2}^{transferred}}{C_{CO2}^{generated}} = \frac{15810000 \text{ kgCO2}}{25500592.8 \text{ kgCO2}} = 0.620 = 62.0\%$$

Where $C_{CO2}^{transferred}$ is defined in Table D.

Fossil Fuel Emissions

The Fossil Fuel Emissions ("FFE") of Generating Unit D per unit of electricity generated is then calculated based on the plant’s design efficiency ("$\eta_{des}$"), the Emission Factor of the fuel used, and the Transferred CO2 factor ("$TCF$"). This is calculated using the equation in Schedule 8, Part 1.2(b) as follows:
Carbon Emissions Limits in the Capacity Market

\[
FFE = \frac{EF_{F,CO_2}}{\eta_{des}} = \frac{0.0036 \times (1 - TCF) EF_{F,CO_2}}{0.510 \times 98300 \frac{kgCO_2}{TJ}} = \frac{gCO_2}{kWh_e} = 263.7
\]

This value of Fossil Fuel Emissions is below the Fossil Fuel Emissions Limit of 550 gCO₂/kWhₑ, so Generating Unit D is eligible to apply to participate in the Capacity Market.

2.5 A Generating Unit using two fuels

This example considers a gas reciprocating engine burning a combination of natural gas and blast furnace gas to produce electricity (“Generating Unit E”). Generating Unit E is not equipped with CCUS technology, and no heat is used elsewhere (i.e. it is not in the CHP Generating Technology Class).

Table E shows the data required to perform the calculations, including the source to be used for each data item.

</tr>
</thead>
<tbody>
<tr>
<td>Installed Capacity</td>
<td>Nominal electrical capacity of Generating Unit E</td>
<td>20 MW</td>
<td>Plant specifications</td>
</tr>
</tbody>
</table>

### Design Efficiency

For Generating Unit E, the Design Efficiency ("\( \eta_{des} \)") of the Generating Unit may be estimated from an appropriate technical data source such as the plant specifications or previous testing data. The value that is selected should be equal to the power generated by the plant for each unit of energy input, on a Net Calorific Value basis, and should be representative of the Generating Unit’s normal operation when burning the mixed fuels. In this example, Generating Unit E’s Design Efficiency is as follows:

\[
\eta_{des} = 0.308 = 30.8\% 
\]

### Fuel Share and Weighted Emissions Factor

To calculate the Fossil Fuel Emissions ("FFE") of Generating Unit E, first a weighted emission factor ("EFw") must be calculated, accounting for the different fuel components. To do this, the Fuel Share for each fuel component is calculated first, using the equation in Schedule 8, Part 8.1 for each fuel separately, as follows:

\[
FS_1 = \frac{Q_{F1} \times NCV_{F1}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})} \left( \frac{2.53 \ Gg \times 48.0 \ TJ}{Gg} \right)
\]

\[
= \left( \frac{2.53 \ Gg \times 48.0 \ TJ}{Gg} \right) + \left( 2.04 \ Gg \times 2.47 \ TJ \ Gg \right) = 0.960 = 96.0\%
\]

\[
FS_2 = \frac{Q_{F2} \times NCV_{F2}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})} \left( \frac{2.04 \ Gg \ kg}{s} \times 2.47 \ TJ \ Gg \right)
\]

\[
= \left( 2.53 \ Gg \times 48.0 \ TJ \ Gg \right) + \left( 2.04 \ Gg \times 2.47 \ TJ \ Gg \right) = 0.040 = 4.0\%
\]

Then the weighted emission factor can be calculated using the equation in Schedule 8, Part 5.1(a) as follows:
\[ EF_W = (FS_{F1} \times EF_{F1}) + (FS_{F2} \times EF_{F2}) \]
\[ = (0.960 \times 56100 \frac{kg \ CO_2}{TJ}) + (0.040 \times 260000 \frac{kg \ CO_2}{TJ}) \]
\[ = 64256 \frac{kg \ CO_2}{TJ} \]

Where \( EF_{F1} \) and \( EF_{F2} \) are defined in Table E.

**Fossil Fuel Emissions**

Finally, the Fossil Fuel Emissions (“\( FFE \)” of Generating Unit E can be calculated, using the plant’s design efficiency (“\( \eta_{des} \)” ) and the weighted emission factor calculated above (“\( EF_W \)” ). This is calculated using the equation in Schedule 8, Part 1.2(c) as follows:

\[ FFE = \frac{0.0036 \times EF_W}{\eta_{des}} = \frac{0.0036 \times 64256}{0.308} = 751.0 \frac{g \ CO_2}{kWh_e} \]

This value of Fossil Fuel Emissions exceeds the Fossil Fuel Emissions Limit of 550 gCO₂/kWhₑ, so Generating Unit E is not compliant. However, if the plant had started commercial production before July 4th 2019, it is able to calculate against the Fossil Fuel Yearly Emissions Limit, as described below.

**Fossil Fuel Yearly Emissions**

The Fossil Fuel Yearly Emissions (“\( FFYE \)” ) of Generating Unit E are calculated from the Fossil Fuel Emissions (“\( FFE \)” ), the annual Electricity Production of the Generating Unit, and its nominal Installed Capacity. The is calculated using the equation in Schedule 8, Part 2.1 as follows:

\[ FFYE = \frac{FFE \times Electricity \ Production}{Installed \ Capacity} = \frac{751.0 \frac{g \ CO_2}{kWh_e} \times 10.8 \ GWh}{20 \ MW} = 405.5 \frac{kg \ CO_2}{kWe} \]

Where the values Electricity Production and Installed Capacity are defined in Table E.

This value of Fossil Fuel Yearly Emissions exceeds the Fossil Fuel Yearly Emissions Limit of 350 kgCO₂/kWe, therefore the plant is ineligible to participate in the Capacity Market.

### 2.6 A Generating Unit using two fuels and equipped with CCUS

This example considers a gas reciprocating engine burning a combination of natural gas and blast furnace gas to produce electricity (“Generating Unit F”). No heat is used elsewhere (i.e. Generating Unit F is not in the CHP Generating Technology Class). Generating Unit F is equipped with post-combustion CO₂ capture technology, with the CO₂ being transferred and utilised elsewhere. Table F shows the data required to perform the calculations, including the source to be used for each data item.

**Table F – Data required to perform calculations for a plant with two fuels applying the mixed fuels and CCUS formula**

### Design Efficiency

For Generating Unit F, the Design Efficiency ($\eta_{des}$) of the Generating Unit must be estimated from an appropriate technical data source such as the plant specifications or previous testing data. The value that is selected should be equal to the power generated by the plant for each unit of energy input, on a Net Calorific Value basis and should be representative of the plant’s normal operation when burning the mixed fuels. In this case, the plant’s Design Efficiency is as follows:
\[ \eta_{des} = 0.308 = 30.8\% \]

**Fuel Share and Weighted Emissions Factor**

To calculate the Fossil Fuel Emissions ("FFE") of Generating Unit F, first a weighted emission factor ("EF\_w") must be calculated, accounting for the different fuel components. To do this, the Fuel Share for each fuel component is calculated first, using the equation in Schedule 8, Part 8.1 for each fuel separately, as follows:

\[
FS_1 = \frac{Q_{F1} \times NCV_{F1}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})} \left( \frac{2.53 \, Gg \times 48.0 \, TJ}{Gg} \right)
\]
\[
= \frac{0.960 \times 56100 \, kg \, CO_2}{(0.960 \times 56100 \, kg \, CO_2) + (0.040 \times 260000 \, kg \, CO_2)} \left( \frac{2.53 \, Gg \times 48.0 \, TJ}{Gg} \right)
\]
\[
= 96.0\%
\]

\[
FS_2 = \frac{Q_{F2} \times NCV_{F2}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})} \left( \frac{2.04 \, Gg \times 2.47 \, TJ}{Gg} \right)
\]
\[
= 4.0\%
\]

Then the weighted emission factor can be calculated using the equation in Schedule 8, Part 5.1(a) as follows:

\[
EF_w = \frac{(FS_{F1} \times EF_{F1}) + (FS_{F2} \times EF_{F2})}{(FS_{F1} \times EF_{F1}) + (FS_{F2} \times EF_{F2})} \left( \frac{kg \, CO_2}{TJ} \right)
\]
\[
= \left( \frac{0.960 \times 56100 \, kg \, CO_2}{(0.960 \times 56100 \, kg \, CO_2) + (0.040 \times 260000 \, kg \, CO_2)} \right) \left( \frac{2.53 \, Gg \times 48.0 \, TJ}{Gg} \right)
\]
\[
= 64256 \, \frac{kg \, CO_2}{TJ}
\]

Where \(EF_{F1}\) and \(EF_{F2}\) are defined in Table F.

**Transferred CO\_2**

As Generating Unit Ft is equipped with CCUS technology, the CCUS formulae can be applied. First, the total CO\_2 emissions generated by Generating Unit F in one year is calculated based on the total fuel consumption ("TFEI") and the weighted Emission Factor calculated above ("EF\_w"). The calculation is performed as follows, using the equation in Schedule 8, Part 7.2(b):

\[
CO2_{generated} = TFEI \times EF_w \times 0.0036
\]
\[
= 35065 \, MWh \times 64256 \, \frac{kg \, CO_2}{TJ} \times 0.0036
\]
\[
= 8111292 \, kg \, CO_2
\]
Carbon Emissions Limits in the Capacity Market

Where $TFE1$ is defined in Table F.

Then the Transferred CO2 Factor ("$TCF$") can be calculated. This uses $CO2_{generated}$ as calculated above, as well as the total CO2 captured at the Generating Unit and transferred elsewhere ("$CO2_{transferred}$"), measured over the same year for which $TFE1$ was measured. The calculation is as follows, using the equation in Schedule 8, Part 4.1:

$$TCF = \frac{CO2_{transferred}}{CO2_{generated}} = \frac{673000 \, kg \, CO2}{8111292 \, kg \, CO2} = 0.830 = 83.0 \%$$

Where $CO2_{transferred}$ is defined in Table F.

Fossil Fuel Emissions

The Fossil Fuel Emissions ("FFE") of Generating Unit F per unit of electricity generated is then calculated based on the plant’s design efficiency ("$\eta_{des}$"), the weighted emission factor calculated above ("$EF_w$"), and the Transferred CO2 factor ("$TCF$"). This is calculated using the equation in Schedule 8, Part 1.2(d) as follows:

$$FFE = \frac{0.0036 \times (1 - TCF)EF_w}{\eta_{des}} = \frac{0.0036 \times (1 - 0.830) \times 64256 \, kgCO_2/TJ}{0.308} = \frac{127.7 \, gCO_2}{kWh_e}$$

This value of Fossil Fuel Emissions is below the Fossil Fuel Emissions Limit of 550 gCO2/kWh, so the Generating Unit is eligible to participate in the Capacity Market.

2.7 A Generating Unit using two fuels and applying the CHP formula

This example considers a gas reciprocating engine burning a combination of natural gas and blast furnace gas, and operating in CHP mode (i.e. both electricity and heat are exported by the Generating Unit so it falls within the CHP Generating Technology Class) ("Generating Unit G"). Generating Unit G is not equipped with CCUS technology. Generating Unit G is covered by a Qualifying CHPQA certificate, which is used to support the calculations. Table G shows the data required to perform the calculations, including the source to be used for each data item.

</tr>
<tr>
<td>$F_e$</td>
<td>Percentage of fuel referable to electricity generation</td>
<td>54.5%</td>
<td>CHPQA certificate</td>
</tr>
</tbody>
</table>

**Design Efficiency**

First the Design Efficiency ($\eta_{des}$) of Generating Unit G must be calculated. This value represents the efficiency of the Generating Unit at maximum output. When applying the Design Efficiency CHPQA Formula, $\eta_{des}$ is calculated using values specified on the CHPQA certificate. The equation is as follows, using the equation in Schedule 8, Part 3.2(c):
\[ \eta_{\text{des}} = \frac{TPO}{TFI \times C_f \times F_e} = \frac{10800 \text{ MWh}}{35065 \text{ MWh} \times 0.9025 \times 0.545} = 0.626 = 62.6\% \]

Where the values \( TPO, TFI, C_f, \) and \( F_e \) are defined in Table G. Note that \( C_f \) is the conversion factor for the primary fuel being used: this should be the fuel with the greatest contribution on an energy basis. If fuels are used with the same total energy input, the fuel with the highest value of \( C_f \) should be used.

### Fuel Share and Weighted Emission Factor

To calculate the Fossil Fuel Emissions ("FFE") of Generating Unit G, first a weighted emission factor ("\( EF_w \)"") must be calculated, accounting for the different fuel components. This is calculated by first calculating the Fuel Share for each fuel component, using the equation in Schedule 8, Part 8.1 for each fuel separately, as follows:

\[
FS_1 = \frac{Q_{F1} \times NCV_{F1}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})} = \frac{(2.53 \, Gg \times 48.0 \, TJ/Gg)}{(2.53 \, Gg \times 48.0 \, TJ/Gg) + (2.04 \, Gg \times 2.47 \, TJ/Gg)} = \frac{0.960}{0.960 + 0.040} = 96.0\%
\]

\[
FS_2 = \frac{Q_{F2} \times NCV_{F2}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})} = \frac{(2.04 \, Gg \times 2.47 \, TJ/Gg)}{(2.53 \, Gg \times 48.0 \, TJ/Gg) + (2.04 \, Gg \times 2.47 \, TJ/Gg)} = \frac{0.040}{0.960 + 0.040} = 4.0\%
\]

Where \( Q_{F1}, Q_{F2}, NCV_{F1} \) and \( NCV_{F2} \) are defined in Table G.

Using these component Fuel Shares, a weighted Emission Factor ("\( EF_w \)"") can also be calculated, using the equation in Schedule 8, Part 5.1(a) as follows:

\[
EF_w = \frac{(FS_{F1} \times EF_{F1}) + (FS_{F2} \times EF_{F2})}{(0.960 \times 56100 \, \frac{kg \, CO_2}{TJ}) + (0.040 \times 260000 \, \frac{kg \, CO_2}{TJ})} = \frac{64256 \, \frac{kg \, CO_2}{TJ}}
\]

Where \( EF_{F1} \) and \( EF_{F2} \) are defined in Table G.
Fossil Fuel Emissions

Finally, the Fossil Fuel Emissions (“FFE”) of Generating Unit G can be calculated, using its Design Efficiency (“\(\eta_{des}\)”) and the weighted emission factor calculated above (“EF\(_W\)”). This is calculated using the equation in Schedule 8, Part 1.2(c) as follows:

\[
FFE = \frac{0.0036 \times EF_W}{\eta_{des}} = \frac{0.0036 \times 64256 \frac{kgCO_2}{TJ}}{0.626} = 369.5 \frac{gCO_2}{kWh_e}
\]

This value of Fossil Fuel Emissions is below the Fossil Fuel Emissions Limit of 550 gCO\(_2\)/kWh\(_e\), so Generating Unit G is eligible to participate in the Capacity Market.

2.8 A Generating Unit using two fuels applying the CHP formula and equipped with CCUS

This example considers a Generating Unit in the CHP Generating Technology Class (i.e. both electricity and heat are exported by the plant), which burns a combination of different coals (anthracite and lignite) (“Generating Unit H”). Generating Unit H is equipped with CCUS technology, and the captured CO\(_2\) is transferred and utilised elsewhere. Generating Unit H is covered by a Qualifying CHPQA certificate, which is used to support the calculations. Table H shows the data required to perform the calculations, including the source to be used for each data item.

### Design efficiency

First the Design Efficiency ("$\eta_{des}$") of Generating Unit H must be calculated. This value represents the efficiency of the Generating Unit at maximum output. When applying the Design Efficiency CHPQA Formula, $\eta_{des}$ is calculated using values specified on the CHPQA certificate. The equation is as follows, using the equation in Schedule 8, Part 3.2(c):

\[
\eta_{des} = \frac{TPO}{TFI \times C_{f,W} \times F_e} = \frac{40390 \text{ MWh}}{175610 \text{ MWh} \times 0.95 \times 0.475} = 0.510 = 51.0\%
\]
Where the values $TPO$, $TFI$, $C_f$, and $F_p$ are defined in Table H. Note that $C_f$ is the conversion factor for the primary fuel being used: this should be the fuel with the greatest contribution on an energy basis. If fuels are used with the same total energy input, the fuel with the highest value of $C_f$ should be used.

### Fuel Share and Weighted Emission Factor

To calculate the Fossil Fuel Emissions ("FFE") of Generating Unit H first a weighted emission factor ("EF_w") must be calculated, accounting for the different fuel components. This is calculated by first calculating the Fuel Share for each fuel component, using the equation in Schedule 8, Part 8.1 for each fuel separately, as follows:

\[
FS_1 = \frac{Q_{F1} \times NCV_{F1}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})}
\]

\[
= \frac{17.0 \text{ Gg} \times 26.7 \text{ TJ}/\text{Gg}}{(17.0 \text{ Gg} \times 26.7 \text{ TJ}/\text{Gg}) + (15.7 \text{ Gg} \times 11.9 \text{ TJ}/\text{Gg})}
\]

\[
= 0.709 = 70.9\%
\]

\[
FS_2 = \frac{Q_{F2} \times NCV_{F2}}{(Q_{F1} \times NCV_{F1}) + (Q_{F2} \times NCV_{F2})}
\]

\[
= \frac{15.7 \text{ Gg} \times 11.9 \text{ TJ}/\text{Gg}}{(17.0 \text{ Gg} \times 26.7 \text{ TJ}/\text{Gg}) + (15.7 \text{ Gg} \times 11.9 \text{ TJ}/\text{Gg})}
\]

\[
= 0.291 = 29.1\%
\]

Where $Q_{F1}$, $Q_{F2}$, $NCV_{F1}$ and $NCV_{F2}$ are defined in Table H.

Using these component Fuel Shares, a weighted Emission Factor ("EF_w") can also be calculated, using the equation in Schedule 8, Part 5.1(a) as follows:

\[
EF_w = (FS_{F1} \times EF_{F1}) + (FS_{F2} \times EF_{F2})
\]

\[
= 0.709 \times 98300 \frac{kg \text{ CO}_2}{TJ} + 0.291 \times 101000 \frac{kg \text{ CO}_2}{TJ}
\]

\[
= 99085.7 \frac{kg \text{ CO}_2}{TJ}
\]

Where $EF_{F1}$ and $EF_{F2}$ are defined in Table H.

### Transferred CO2

As Generating Unit H is equipped with CCUS technology, the CCUS formulae can be applied. First, the total CO2 emissions generated by the Generating Unit in one year is calculated based on the total fuel consumption ("TFEI") and the weighted Emission Factor ("EF_w"). The calculation is performed as follows, using the equation in Schedule 8, Part 7.2(b):
Carbon Emissions Limits in the Capacity Market

\[
C_{2\text{generated}} = TFEI \times EF_W \times 0.0036 \\
= 72060 \text{ MWh} \times 99085.7 \frac{kgCO_2}{TJ} \times 0.0036 \\
= 25704416.0 kgCO_2
\]

Where \( TFEI \) is defined in Table H, and \( EF_{W, F} \) is the value calculated above. Note that the total fuel consumption \( TFEI \) does not have to be measured over the same twelve months period as that used in the CHPQA certificate, and thus, as is the case in this example, \( TFEI \) does not necessarily equal \( TF1 \).

Then the Transferred CO₂ Factor (“\( TCF \)” can be calculated. This uses \( C_{2\text{generated}} \) as calculated above, as well as the total CO₂ captured at Generating Unit H and transferred elsewhere (“\( C_{2\text{transferred}} \)”).

Note that \( C_{2\text{transferred}} \) must be measured over the same twelve months period for which \( TFEI \) was measured. The calculation is as follows, using the equation in Schedule 8, Part 4.1:

\[
TCF = \frac{C_{2\text{transferred}}}{C_{2\text{generated}}} = \frac{15810000 \text{ kgCO}_2}{25704416.0 \text{ kgCO}_2} = 0.615 = 61.5 \%
\]

Where \( C_{2\text{transferred}} \) is defined in Table H.

Fossil Fuel Emissions

The Fossil Fuel Emissions (“FFE”) of Generating Unit H per unit of electricity generated is then calculated based on the plant’s design efficiency (“\( \eta_{des} \)”), the weighted Emission Factor calculated above, and the Transferred CO₂ factor (“\( TCF \)”)

This is calculated using the equation in Schedule 8, Part 1.2(d) as follows:

\[
FFE = \frac{0.0036 \times (1 - TCF)EF_W}{\eta_{des}} \\
= \frac{0.0036 \times (1 - 0.615) \times 99085.7 \frac{kgCO_2}{TJ}}{0.510} \\
= \frac{269.3 \frac{gCO_2}{kWh_e}}{269.3 \frac{gCO_2}{kWh_e}}
\]

This value of Fossil Fuel Emissions is below the Fossil Fuel Emissions Limit of 550 gCO₂/kWhₑ, so Generating Unit H is eligible to participate in the Capacity Market.
