# Income Tax Liabilities Statistics 2011-12 to 2014-15

## Tables 2.1-2.7

## Contents

Background notes	3
SECTION A: Income Tax Liabilities Statistics	7
Summary of key statistics	7
Table 2.1 – Number of individual income taxpayers by marginal rate, gender and age, 1990-91 to 2014-15	8
Table 2.2 – Number of individual income taxpayers by country and region, 1999-00 to 2014-15	11
Table 2.4 – Shares of total income (before and after tax) and income tax for percentile groups, 1999-00 to 2014-15	13
Table 2.5 – Income tax liabilities, by income range, 2011-12 to 2014-15	16
Table 2.6 – Income tax liabilities, by income source and tax band, 2011-12 to 2014-15	19
SECTION B: Illustrative tax burdens	37
Table 2.7 – Income tax (net of tax credits) as a per cent of gross earnings for specimen families, 1990-91 to 2014-15	37
Annex A: Context and background information	43
Annex B: Data sources and methodology	48
Annex C: Quality	60
Annex D: Glossary	66

## Background notes

Income Tax Liabilities Statistics (ITLS) is a National Statistics publication by HM Revenue and Customs (HMRC). For more information about National Statistics, please see the UK Statistics Authority website:

<http://www.statisticsauthority.gov.uk/>

The United Kingdom Statistics Authority (UKSA) has confirmed that the ITLS statistics and projections are designated as National Statistics, following HMRC implementing the enhancements listed in Assessment Report 157 *Statistics on Income Tax* and Assessment Report 241 *Income Tax Projections*, available at:

<http://www.statisticsauthority.gov.uk/assessment/assessment/assessment-reports/index.html>

## Data sources, methods and quality

These statistics are based on HMRC's annual Survey of Personal Incomes (SPI), a representative sample survey of the tax records of individuals in HMRC's Pay As You Earn (PAYE), Self Assessment (SA) and repayment claims administrative systems. Individuals' tax liabilities are estimated using the information SPI provides on taxpayer incomes and circumstances (e.g. their age).

Data sources and methods are described in Annex B, including information on changes to imputation methods introduced for the 2011-12 SPI survey (page 62). Information about the quality of the statistics is set out in Annex C.

As in previous releases, ITLS Table 2.2 provides projections of taxpayer numbers by taxpayer marginal rate for countries and regions. These projections are indicative only and users should note that the reliability of these projections by country and region is under review, with the possibility that they be withdrawn from future releases (Annex C).

## New in this release and next release

ITLS was last published in February 2014. This release provides revised projections for tax years 2012-13 and 2013-14, as well as the first estimates for the 2014-15 tax year, based on the 2011-12 SPI data. The data is projected using economic assumptions consistent with the Office for Budget Responsibility's (OBR) March 2014 *Economic and fiscal outlook*:

<http://budgetresponsibility.org.uk/economic-fiscal-outlook-march-2014/>

ITLS is usually published twice yearly, in January/February and April/May, with revised projections based on the OBR's latest published economic forecast, until final statistics based on outturn SPI survey data can be published. The next scheduled release will be in January/February 2015, containing updated projections to 2014-15 following the OBR's Autumn Statement 2014 economic forecast. The exact date of publication will be given not less than one calendar month before publication on both the HMRC website and Office for National Statistics (ONS) publication hub.

The 2008-09 SPI is still unavailable but HMRC remains committed to producing the 2008-09 SPI and National Statistics Tables 3.1 to 3.15a for 2008-09 and will announce their publication dates as soon as they have been confirmed.

## Relevance of ITLS

ITLS Section A provides detailed outturn statistics and projections of individual income taxpayer numbers, income tax liabilities and average rates of tax broken down by taxpayer characteristics such as age and gender, income levels and groupings (e.g. the richest 10%), and by marginal rate of tax (e.g. basic rate taxpayers). Section A also shows tax liabilities arising on different forms of income subject to income tax and in each tax band. As a complement to the survey-based statistics, ITLS Section B sets out trends in income tax burdens over time for a selection of illustrative family types and earnings levels.

HMRC also publishes statistics on income tax receipts:  
<http://www.hmrc.gov.uk/statistics/income-tax-receipts.htm>

Liabilities are amounts of income tax due on incomes arising in a given tax year whereas receipts are amounts of income tax paid and collected in a given year. Statistics on income tax liabilities and receipts in any year can differ appreciably, due to lags in the payment and collection of tax particularly under SA, or when over or underpayments occur which are repaid or recovered in a later year. Data sources and methods underpinning the statistics also differ. Receipts statistics are based on aggregate administrative data sources whereas liabilities statistics are compiled using a sample of individuals' tax records.

The detailed breakdowns of income tax liabilities provided in ITLS, e.g. by taxpayer income or marginal rate, are not available on a receipts basis, and are not generally available in other statistical publications. Liabilities statistics also reflect more closely and immediately than tax receipts the impact of changes in the income tax policy regime and developments in the wider economy.

Due to the time needed to receive and process tax returns and information provided by employers, SPI survey results are subject to a lag of several years. Projections up to the current tax year, 2014-15, are provided to bring the statistics up to date, and enhance their timeliness and usability. Projections beyond the current tax year are not provided as tax rates, allowances and thresholds impacting on the statistics are not known until announced by the Government.

The projections methods, described in Annex B, have been chosen to suit ITLS' key purpose of providing informative breakdowns of income taxpayers and liabilities. Provision of projections of total tax is not a key purpose of the ITLS release, and the use of other data sources and alternative projection methods would be required to make them suitable for that particular purpose. They should not be seen or used as alternative or competitor forecasts of income tax produced by other organisations.

The Office for Budget Responsibility was created in 2010 to provide independent and authoritative analysis of the UK's public finances, and twice yearly publishes five-year forecasts for the economy and public finances, including income tax receipts: <http://budgetresponsibility.independent.gov.uk/>

## Use of ITLS

The ITLS statistics are used by a variety of organisations mainly concerned with Government decision making about tax policy, both in a policy making and policy monitoring context.<sup>1</sup>

The projections form the basis for HMRC's detailed assessments of the Exchequer costs and impacts on individuals of potential changes to the income tax system which inform the Government's tax policy decisions, and they are used by other Government departments for similar purposes.

They are also used by Parliament, Government departments such as HM Treasury, some private organisations including policy 'think tanks', as well as the media and other commentators to monitor income tax trends and distributions. They inform, for example, users' assessments of the impacts of past tax policy changes or the sustainability of the UK public finances. For some users, such as the Office for Budget Responsibility, the statistics are used explicitly in an economic and tax forecasting context, informing assessments of recent trends or used as specific inputs to the forecasting process.

The statistics are also used by HMRC and other organisations including the Office for Tax Simplification in assessments of the operation of the UK income tax system and its impact on individuals.

While HMRC has regular contact with some key users of the ITLS statistics within Government, we would like to improve our knowledge of the use made of the ITLS statistics and projections, particularly by private sector organisations and individuals. We encourage users to provide feedback on their use of the statistics including any decisions they may inform, together with their requirements and any improvements they would like to see by using the contact points set out below.

## Comments and questions

If you have comments or queries on these statistics, please contact the statistical contacts named on the front page of this release, or use HMRC's user engagement form: <http://www.hmrc.gov.uk/statistics/feedback.htm>

User comments are reviewed regularly, and results of surveys and consultations are published. Information on the most recent survey of users of HMRC income tax statistics is available here:

[http://webarchive.nationalarchives.gov.uk/20120609144700/http://hmrc.gov.uk/stats/income\\_tax/user-survey-results.pdf](http://webarchive.nationalarchives.gov.uk/20120609144700/http://hmrc.gov.uk/stats/income_tax/user-survey-results.pdf)

## Further information

Further information setting out the context for these statistics and projections is provided in Annex A. This includes an introduction to the UK income tax system

---

<sup>1</sup> UKSA Monitoring Brief 6/2010 *The Use Made of Official Statistics* provides a generic framework for classes of use of Official Statistics: <http://www.statisticsauthority.gov.uk/assessment/monitoring/monitoring-reviews/monitoring-brief-6-2010---the-use-made-of-official-statistics.pdf>

and a summary of recent income tax policy changes which impact on the ITLS statistics. Annex D provides a glossary of terms.

## SECTION A: Income Tax Liabilities Statistics

### Summary of key statistics

**Key outturns** for taxpayers and income tax liabilities in 2011-12 are:

- 30.8 million individual income taxpayers in 2011-12, a fall of 0.5 million compared with the previous year.
- 26.9 million non-higher rate taxpayers (87.6% of all taxpayers), 3.57 million higher rate taxpayers (11.6%), and 262,000 additional rate taxpayers (0.9%).
- average rates of tax were 11.7% for basic rate taxpayers, 22.8% for higher rate taxpayers, and 39.9% for additional rate taxpayers.
- the richest 50% of taxpayers by total income accounted for a 76.2% share of total income and 89.3% of tax liabilities.
- the richest 1% of taxpayers by total income accounted for a 11.5% share of total income and 25.4% of tax liabilities.
- 57.5% of tax liabilities were due on taxable incomes falling within the basic rate tax band, 27.1% in the higher rate band, and 15.3% in the additional rate band.

**Projections** for tax years 2012-13 to 2014-15 show:

- 29.9 million taxpayers in 2014-15, 0.8 million lower than in 2011-12.
- 4.6 million higher rate taxpayers in 2014-15, 1.0 million higher than in 2011-12, and 343,000 additional rate taxpayers in 2014-15.
- average rates of tax fall in 2014-15 to 10.3% for basic rate taxpayers, 22.0% for higher rate taxpayers, and 38.0% for additional rate taxpayers.

**Users should note that recent outturns and projections for the highest income taxpayers are strongly affected by expected responses to changes in the top rate of income tax.**

The remainder of this section provides more detailed commentary and statistics on income taxpayers and liabilities in 2011-12, and the projections to 2014-15, followed by the detailed tables.

**Table 2.1 – Number of individual income taxpayers by marginal rate, gender and age, 1990-91 to 2014-15:** shows how the number of individuals with positive income tax liabilities (taxpayers) has changed over time. The table begins in 1990-91, the year that independent taxation for all individuals was introduced in the UK; previously married couples were taxed jointly. The table provides separate breakdowns of the income taxpaying population by taxpayers' marginal tax rate, by gender and by age group.

**Figure 1: Income taxpayers**

Latest available SPI survey data shows an estimated 30.8 million taxpayers in 2011-12, of which 17.3 million (56.3%) were male, and 5.98 million (19.5%) above the State Pension Age. Comparable figures for the UK population aged 16 and over in 2011 are 49.1% male, and 19.0% above State Pension Age.<sup>2</sup>

An individual's marginal tax rate – the proportion of an extra pound of income that would be paid in income tax – depends on their total taxable income and its composition. In 2011-12, an estimated 26.9 million individuals, representing the large majority of all income taxpayers (87.6%) were non-higher rate taxpayers<sup>3</sup>, with no liabilities due at the higher rates of tax. A further 3.57 million individuals (11.6%) were higher rate taxpayers and 262,000 (0.9%) were liable to the additional rate of tax introduced in April 2010. Basic, higher, and additional rates of tax on earnings and savings were 20%, 40%, and 50% respectively in 2011-12; lower rates applied to dividend income.

<sup>2</sup> Office for National Statistics Mid Year Population Estimates for 2011, <http://www.ons.gov.uk/ons/publications/re-reference-tables.html?edition=tcm%3A77-319259> State Pension Age for the purposes of this publication in 2011-12 is 65 years for men and 61 years for women.

<sup>3</sup> Non-higher rate taxpayers comprise starting, savers and basic rate taxpayers who pay no tax at the higher or additional rate.

Among non-higher rate taxpayers, there were 318,000 starting rate taxpayers (1.0% of all taxpayers), classified as those with taxable savings only below the £2,560 starting rate limit on which a 10% tax rate applied. A further 621,000 (2.0%) without taxable earnings but with taxable savings above the starting rate limit and/or taxable dividends were savers rate taxpayers, where rates of 20% and 10% applied to savings and dividends. The remaining 26.0 million (84.5%) non-higher rate taxpayers had taxable earnings and are classified as basic rate taxpayers.

Taxpayer numbers fell by 0.5 million to 30.8 million in 2011-12; more than explained by the £1,000 cash increase in the personal allowance for adults aged under 65. This followed a rise in taxpayer numbers in 2010-11 as a result of personal allowances being held constant in cash terms in 2010-11.

Projections to 2014-15 show taxpayer numbers declining further by 0.8 million to 29.9 million in 2014-15. With limited growth in incomes in the period since 2011, these projected reductions in taxpayer numbers reflect significant increases in the personal allowance for under 65s, with a rise in 2012-13 £210 above indexation, a rise in 2013-14 £1,115 above indexation, and a rise £260 above indexation in 2014-15. In cash terms, the personal allowance for under 65s rose from £7,475 in 2010-11 to £10,000 in 2014-15. Age-related allowances, by contrast, rose with RPI indexation in 2012-13 before being frozen in 2013-14 and 2014-15, meaning the number of taxpayers aged 65 and over is projected to rise by 0.8 million by 2014-15.

Within the total, numbers liable at the higher and additional rates of tax are projected to rise by 1.1 million, from 3.83 million (12.4% of taxpayers) in 2011-12 to 4.95 million (16.6%) in 2014-15. While the proportion of taxpayers liable at higher rates normally rises over time as income growth typically exceeds price indexation of tax thresholds, UK earnings growth was below RPI inflation for income tax indexation in this particular period. Increases in higher rate taxpayers therefore tend to reflect developments in the higher rate threshold for income tax. This was frozen at the 2011-12 level of £42,475 in 2012-13 before falling to £41,450 in 2013-14 before rising by a capped rate of 1% to £41,865 in 2014-15.

Within the 1.1 million rise in the numbers liable at higher rates of tax, the number of additional rate taxpayers is projected to rise from 262,000 in 2011-12 to 343,000 by 2014-15. Projections of additional rate taxpayers in 2012-13 and 2013-14 are subject to considerable uncertainties, not least concerning likely responses of high income individuals to the reduction in the additional rate of income tax from 50% to 45% in 2013-14, but with projected underlying growth in numbers in part explained by the £150,000 additional rate threshold being fixed in cash terms.

*Interpreting Table 2.1: Starting, savers and basic rate taxpayers are non-higher rate taxpayers, and might all be considered “basic” rate taxpayers in the sense that no tax is due at higher rates. The separate categories are published recognising that the highest marginal rate of tax paid will depend on the make-up of their taxable income, and this affected significant numbers of taxpayers particularly before April 2008 when the starting rate of tax on earnings was removed. Classification of taxpayers by marginal rate is described in Annex B, and is subject to discontinuities over time reflecting the changing structure of UK income tax.*

*The SPI is an annual cross section sample survey comprising a different sample of taxpayers each tax year. Changes in taxpayer numbers between years will in part reflect sampling variation (Annex C). Changes to SPI survey methods may also lead to some discontinuities in the accumulated time-series estimates of taxpayer numbers in survey years up to 2011-12.*

**Table 2.2 – Number of individual income taxpayers by country and region, 1999-00 to 2014-15:** provides a breakdown of trends in individual taxpayer numbers over time by country and Government Office Region.

**Figure 2: Income taxpayers by country and region, 2011-12**

In 2011-12, the largest number of taxpayers are estimated to reside in the South East (14.6% of the total), followed by London (12.8%) and the North West (10.6%) Government Office Regions. The countries and regions with the lowest number of taxpayers are Northern Ireland (2.4%), followed by the North East (3.8%) and Wales (4.6%). These rankings closely mirror in country and regional shares in the UK population aged 16 and over.

Within the taxpayer totals for 2011-12, there are three regions where the proportion of higher and additional rate taxpayers exceeds the UK average (12.4%): London (19.6%), the South East (16.8%), and East of England (14.3%). By contrast, under-representation of higher and additional rate taxpayers is most marked in Wales (7.7%), Northern Ireland (7.7%) and the North East (8.2%).

Taxpayer numbers fell across nearly all countries and regions in 2011-12 compared with 2010-11, with the exception of London which showed a small increase of 22,000 taxpayers. The three regions with the largest falls in taxpayer numbers were Yorkshire and the Humber (3.2%), Scotland (2.9%), and the North West (2.4%), compared with 1.7% for the UK as a whole.

ITLS projections show taxpayer numbers declining by between around 2% and 4% across the countries and regions between 2011-12 and 2014-15, in line with the UK projection of a 2.7% decline. These regional projections of taxpayer numbers are indicative, and show close correspondence with the expected UK trend. The projection methods take account only of relevant economic and other trends only at UK level; irrespective of the place of residence of each individual in the SPI data (see Annex B).

Projections of additional rate taxpayer numbers by regions and country for 2012-13, 2013-14, and 2014-15 are highly indicative, and are published for

continuity with past publications while HMRC assesses their reliability (see Annex C).

*Interpreting Table 2.2: Taxpayer country and region for individuals in the SPI data are determined by individuals' residential postcode (not, for example, place of work if any). Projections of taxpayer numbers by country and region beyond the 2011-12 outturns are based on economic outturns/projection assumptions applying generally to the UK as a whole, and should be regarded as indicative in that they make no explicit allowance for geographical variations in economic trends. Annex B provides further details.*

**Table 2.4 – Shares of total income (before and after tax) and income tax for percentile groups, 1999-00 to 2014-15:** *shows how the distributions of individual incomes and tax liabilities have changed since 1999-00. Shares in total income assessable for income tax of different income groups provide one measure of how equally income is distributed across the taxpaying population. Shares of total tax liabilities for different income groups reflect both the underlying distribution of incomes assessable for tax and also the progressivity of the income tax system.*

**Figure 3: Shares of total income by taxpayer total income decile, 2011-12**

**Figure 4: Shares of tax liabilities by taxpayer total income decile, 2011-12**

Taxpayers in the top half of the before tax total income distribution (the richest 50%) accounted for a 76.2% share of total income before tax in 2011-12, compared with a 23.8% share for those in the bottom half of the income distribution. Shares in total tax liabilities of high income groups exceed their income shares, reflecting the progressive structure of the income tax system. The richest 50% of taxpayers accounted for 89.3% of tax liabilities in 2011-12, compared with 10.7% for the bottom half.

Table 2.4 shows that the distribution of total income among taxpayers has tended to become less equal over time. The income share for the richest 50% of taxpayers rose by 0.9 percentage points between 1999-00 and 2009-10. This is more than explained by developments at the very top of the taxpayer income distribution. The income share for the top 1% rose by 2.9 percentage points over the same period, but declined for taxpayer groups below the 95<sup>th</sup> percentile.

The total income share of the richest 1% of taxpayers, however, fell sharply in 2010-11 to 11.5%, down 2.4 percentage points on 2009-10, remaining at this rate in 2011-12. Their share of tax fell by 1.5 percentage points to 25.0% in 2010-11 before rising by 0.4% in 2011-12. Income shares in these years are affected by changes to the additional rate of income tax. While these assessments are subject to significant uncertainties this probably represents a temporary reduction in incomes below 'normal' levels in 2011-12, the counterpart of the bringing forward or 'forestalling' of income in 2009-10 by individuals affected by the introduction of the additional rate of tax in April 2010. Income forestalling was estimated by HMRC at around £16-18 billion or 2% of total taxpayer income

among broadly the richest 1% in 2009-10. Details of these effects were set out in a HMRC report.<sup>4</sup>

The impact of these possible behavioural responses means that the top 1% share of income is:

- artificially high in 2009-10,
- artificially low in 2010-11 and 2011-12  
(relating to the introduction of the 50p rate in April 2010).
- artificially low in 2012-13
- artificially high in 2013-14  
(reflecting the fall in the additional rate to 45p in April 2013).

Annex B (page 56) describes in more detail HMRC's estimates of possible behavioural responses to the additional rate of income tax.

**Projections of shares of income and tax for percentile groups in 2012-13 to 2014-15 should be considered indicative, as the projection of incomes for all taxpayers generally takes account only of expected growth in incomes in aggregate.** The projections do, however, allow for differential earnings growth across the pay distribution consistent with past trends and also continued forestalling effects associated with changes in the additional rate of tax.

The top 1% share of income is projected to fall slightly (from 11.5% to 11.2%) in 2012-13 before rising to 13.0% in 2013-14 reflecting likely deferral of incomes to 2013-14 ahead of the reduction in the additional rate to 45%. In 2014-15 – the first year relatively unaffected by forestalling/unwinding – the top 1% share of income is projected to be slightly lower, at around 12.6%.

The top 1% share of tax is projected to rise from 25.4% in 2011-12 to 28.3% in 2013-14 before falling back to 27.4% in 2014-15. These trends will also be distorted by changes in the additional rate of tax as discussed above.

Shares of tax for the top 10% of taxpayers are also projected to rise between 2011-12 and 2014-15. The higher rate threshold for income tax declined in cash terms over the same period.

*Interpreting Table 2.4. The table relates to taxpayers only, as the SPI survey provides complete coverage only for this group. The table does not provide a complete picture of individual income inequality in the UK due to the exclusion of non taxpayers, and because the SPI records only those incomes that are assessable for tax (e.g. a range of non-taxable social security benefits, tax credits are not included).*

*Taxpayers are ranked on the basis of total income assessable for tax (earnings, savings and dividends incomes) before any deductions (e.g. pension contributions) and tax allowances, and then divided into specific groups (e.g. lowest and highest 50% by total income). Income levels at specific percentile points of the taxpayer total income distribution have been added to Table 2.4 to help users.*

<sup>4</sup> The Exchequer effect of the 50 per cent additional rate of tax:  
<http://www.hmrc.gov.uk/budget2012/excheq-income-tax-2042.pdf>

**Table 2.5 – Income tax liabilities, by income range, 2011-12 to 2014-15:** shows numbers of taxpayers and their tax liabilities by range of total income and marginal rate of tax. Analysis by income range provides a snapshot of the distribution of taxpayer incomes in a given tax year. Analysis by marginal rate provides a snapshot of the tax liabilities of e.g. basic and higher rate taxpayers in a given tax year.

**Figure 5: Average rate of income tax by income range, 2011-12 and 2014-15**

In 2011-12, an estimated 2.7 million taxpayers (8.9% of the total) had total income assessable for tax between the personal allowance for under 65s of £7,475 but below £10,000, while 12.3 million (40.1%) had total income between £10,000 and £20,000, and 12.9 million (41.8%) had total income between £20,000 and £50,000. Combined these groups accounted for 90.8% of all taxpayers in 2011-12.

Numbers of taxpayers with total incomes above £50,000 in 2011-12 were much smaller by comparison at 2.8 million (9.2%). Table 2.5 also shows that there are small numbers of taxpayers with very high incomes, including an estimated 11,000 with incomes above £1,000,000, among which 3,000 have income above £2,000,000. The distribution of taxpayers by total income therefore exhibits significant right skew.

Average rates of tax rise with total income, for example from 10.3% of total income in 2011-12 for those with incomes between £15,000 and £20,000 and 12.9% for incomes between £20,000 and £30,000 (median taxpayer income was £20,300 in 2011-12). They then rise to 22.2% for those with incomes between £50,000 and £100,000 (within the higher rate tax band), and to 33.3% for those with incomes between £150,000 and £200,000 (within the additional rate band). The average rate of tax for those with incomes above £200,000 rises to a peak of 43.1% for individuals earning £1,000,000 - £2,000,000 before falling slightly to 42.6% for those in the £2,000,000 and over income band.

The distribution of total tax liabilities by taxpayers' marginal rate therefore shows marked differences with the distribution of taxpayer numbers. In 2011-12, non-higher rate taxpayers (comprising starting, savers and the basic rate) taxpayers represented the large majority of taxpayers by number (87.6%) but accounted for less than half of total liabilities (40.9%). Higher rate taxpayers by contrast (11.6% by number) accounted for 35.0% of total tax liabilities and additional rate taxpayers (0.9% by number) accounted for 24.1% of total tax liabilities<sup>5</sup>.

Projections for 2012-13 through to 2014-15 show increasing taxpayer numbers for all income bands over £15,000 compared with 2011-12, reflecting expected growth in the population, employment and incomes. However, this is more than offset by the removal of taxpayers with total income below £10,000, falling from 2.7 million in 2011-12 to zero over the same period. This reflects significant above indexation increases in the personal allowance, which rose from £7,475 in 2011-12, to £10,000 in 2014-15, contributing to a projected 0.8 million reduction overall in taxpayer numbers by 2014-15.

The average rate of tax across all taxpayers is projected to fall slightly from its 2011-12 outturn (17.6%) to 17.5% in 2014-15. Average rates of tax, however, are projected to fall markedly for those in income groups below £30,000; these reductions are around 2 percentage points for income bands below £20,000. These projected falls again reflect increases in personal allowances for under 65s. All else equal, these cash increases in the personal allowance conferred essentially fixed reductions in tax due for basic rate taxpayers over the period, and so their impact on average tax rates becomes progressively smaller as income rises.

For taxpayers in the higher rate bands, there are two main changes between 2011-12 and 2014-15. Firstly, the basic rate limit fell by £3,135 which when accompanied by the £2,525 increase in the personal allowance meant that the higher rate threshold fell by £610 in cash terms. At the same time, the additional rate of tax fell from 50% to 45% in April 2013.

So for taxpayers in the £50,000 - £100,000 income band the average rate of income tax fell by around 0.6% since the cash gains from the rise in the personal allowance (typically £1,010 for higher-rate taxpayers at a marginal rate of 40%) over that period outweighed the cash losses from the reduction in the basic rate limit (typically £627 for higher-rate taxpayers). Taxpayers with incomes sufficiently above £100,000 do not receive a personal allowance, and so increased tax due to the reduction in the basic rate limit drives increased tax rates for some high earners in groups above £100,000. For the highest earners, the reduction in the additional rate of income tax from 50% to 45% in April 2013 has led to income groups above £200,000 experiencing falls in their average tax rates with increasing falls in average tax rates with rising incomes. The share of total liabilities accounted for by higher and additional rate taxpayers combined is projected to rise from 59.1% in 2011-12 to 67.5% in 2014-15<sup>6</sup>.

---

<sup>5</sup> 2011-12: Non-higher rate taxpayer liabilities = £63.7bn, higher-rate liabilities =£54.4bn, additional rate taxpayer liabilities = £37.5bn. Total taxpayer liabilities = £156bn

<sup>6</sup> 2014-15: higher and additional rate taxpayer liabilities = £116.0bn. Total taxpayer liabilities = £172bn

*Interpreting Table 2.5. Income groups are defined in the table in terms of the lower limit for total income before any deductions, allowances and tax credits. Taxable income is net of these deductions, allowances, and credits, and this explains why total income for some taxpayers at each marginal tax rate in Table 2.5 exceeds the corresponding limits for taxable incomes that apply to the tax bands (e.g. total income for some basic rate taxpayers significantly exceeds the basic rate limit for taxable income). The lowest income limit shown for each tax year corresponds to the personal allowance for individuals aged under 65.*

*Column totals for tax liabilities of taxpayers by marginal rate show total liabilities of such taxpayers, including liabilities paid at other rates of tax (e.g. total liabilities of higher rate taxpayers includes liabilities due at the basic and other rates of income tax). For each income group, the average rate of income tax is calculated as total tax liabilities expressed as a percentage of total income defined above. Deductions, allowances and tax credits will vary across individuals within each group contributing to differences in individual tax rates within groups over and above differences in individual incomes. An individual's marginal rate of tax places an upper limit on their average rate of tax due on their total income; average tax rates therefore rise with income towards 50% from 2011-12 to 2012-13 and 45% in 2013-14 .*

**Table 2.6 – Income tax liabilities, by income source and tax band, 2011-12 to 2014-15:** shows total tax liabilities due broken down by income source (earnings, savings and dividends) and by income tax band. It also shows average tax rates by taxpayer marginal rate.

**Figure 5: Average rate of income tax by income range, 2011-12 and 2014-15**

In 2011-12, the large majority of total income tax liabilities of £156.0 billion were due on earned income (92.9% of the total<sup>7</sup>). Earnings in this context include earnings from employment, but also profits from self-employment, pensions, taxable state benefits and income from property. Remaining shares in total liabilities were 5.4%<sup>8</sup> for dividends income and 1.7%<sup>9</sup> for savings income. These results largely reflect the composition of taxpayer incomes by source.<sup>10</sup>

In 2011-12, £89.4 billion of tax liabilities (57.5% of the total) were due on taxable incomes falling within the basic rate tax band (applying to the first £35,000 of taxable income in 2011-12), compared with £42.2 billion (27.1%) in the higher rate band (taxable income above £35,000 and up to £150,000) and £23.9 billion (15.3%) in the additional rate tax band. Just £93 million of tax liabilities (0.1%) were due on taxable incomes in the starting rate band, which applied to the first £2,560 of taxable savings only in 2011-12 (the starting rate for earnings was abolished in 2008-09).

<sup>7</sup> 2011-12: tax on earnings income at the basic rate = £86.0bn, at the higher rate = £37.4bn, at the additional rate = £21.1bn; totalling £144.6bn.

<sup>8</sup> 2011-12: tax on dividend income at the ordinary rate = £2.4bn, at the higher rate = £3.8bn, at the additional rate = £2.2bn; totalling £8.4bn.

<sup>9</sup> 2011-12: tax on savings income at the starting rate = £93m, at the basic rate = £1.0bn, at the higher rate = £0.9bn, at the additional rate = £0.6bn; totalling £2.6bn.

<sup>10</sup> HMRC also publishes detailed statistics on taxpayer incomes based on the SPI data: <http://www.hmrc.gov.uk/statistics/personal-incomes.htm>

As a complement to Table 2.5, average rates of income tax for taxpayers by taxpayer marginal rate are also shown in Table 2.6. Average rates are estimated to be 11.7% for basic rate taxpayers, 22.8% for higher rate taxpayers, and 39.9% for additional rate taxpayers in 2011-12, compared with headline marginal tax rates of 20%, 40%, and 50% on earnings. Average rates of tax in 2011-12 were 1.9% for starting rate taxpayers (individuals with savings income below the starting rate limit and no taxable earnings) and 6.2% for savers rate taxpayers (with taxable savings above the starting rate limit or taxable dividends but no taxable earnings). Headline marginal rates were 10% for starting rate savings, 20% for basic rate savings and 10% for dividends.

Tax liabilities on earnings rose by £2.3 billion (1.6%) in 2011-12 compared with 2010-11, but fell by £0.1 billion for savings income (-4.1%) while rising £1.8 billion (26.4%) for dividends recovering some of the significant fall in 2010-11. This jump in dividends tax likely reflected the unwinding of liabilities brought forward from 2010-11 to 2009-10 associated with the introduction of the additional rate.

Projections for 2012-13 to 2014-15 show that tax liabilities on savings income are projected to rise year-on-year in 2012-13 (+2.5%) and 2013-14 (+0.4%) before a large rise in 2014-15 (+18.5%), while tax on earnings and dividends also rise further, the latter by a cumulative 44.3% by 2013-14 and then 59.9% by 2014-15 from its 2011-12 outturn. The share of dividends liabilities in total liabilities is projected to increase to 7.8% by 2014-15.

Liabilities due at the additional rate of tax are projected to recover as the incomes of the highest earners return to normal levels after 2010-11, with the additional rate share in total liabilities rising from 15.3% in 2011-12 to 18.5% in 2014-15.

**HMRC's assessment of the Exchequer effect from the introduction of the additional rate was set out in the report published at Budget 2012<sup>11</sup>. It is not possible to infer the revenue effects from changes in the additional rate using ITLS Table 2.6 as this gives no indication of behavioural responses, which have been shown to be significant.**

The share of higher rate liabilities in total tax is also projected to increase from 27.1% in 2011-12 to 31.6% in 2014-15. Correspondingly, the basic rate liabilities share falls from 57.5% in 2011-12 to 49.9% in 2014-15, reflecting a significant compression of the width of the basic rate band over the same period.

For basic rate taxpayers, the average rate of income tax is projected to fall from 11.7% in 2011-12 to 11.3% in 2012-13, 10.5% in 2013-14, and then 10.3% in 2014-15, following increases in personal allowances for under 65s in these years. The average rate for higher rate taxpayers is also expected to decline, from 22.8% in 2011-12 to 22.0% by 2014-15. The average rate for additional rate taxpayers is also projected to fall from 39.9% in 2011-12 to 38.0% in 2014-15, reflecting the reduction in the top rate of tax. The average rate of tax across all taxpayers, however, is projected to remain broadly stable at 17.5%, marginally down on the 17.6% level in 2011-12, reflecting a rising income share for higher

---

<sup>11</sup> *The Exchequer effect of the 50 per cent additional rate of tax:*  
<http://www.hmrc.gov.uk/budget2012/excheq-income-tax-2042.pdf>

income taxpayers. So while the average rate for each band of taxpayers is projected to fall, the distribution of taxpayers across those bands shifts upward.

*Interpreting Table 2.6. The purpose of Table 2.6 is to provide breakdowns of income tax liabilities by income source, by tax band and taxpayer marginal rate. Projections of total liabilities shown here and in other tables are for reference, but please see background notes on relevance and use of ITLS statistics and projections.*

*Dividends liabilities are shown gross of the 10% dividends tax credit that covers the first 10% of tax due on dividends income for all taxpayers. Estimates of total liabilities for given tax bands include tax paid on incomes in that band by all taxpayers, e.g. totals for starting rate tax include the starting rate tax liabilities of basic and higher rate taxpayers.*

## 2.1 Number of individual income taxpayers by marginal rate, gender and age, 1990-91 to 2014-15

Numbers: thousands

Year	All taxpayers	Lower (1) or starting (2) rate	"Savers" (3) rate	Basic (4) rate	Higher (5) rate	Additional (6) rate	Males	Females	Under 65's	65's and over	State Pension Age (7)

Table updated April 2014

### Key

. not applicable / zero

### Footnotes for tables 2.1

(a) Figures for 2008-09 tax year are not currently available.

(1) Taxpayers with total taxable income below the lower rate limit and some taxpayers whose savings and dividend income took them above the lower rate limit. From 1993-94 until 1998-99 a number of taxpayers with taxable income in excess of the lower rate limit only paid tax at the lower rate. This was because it was only their dividend income and (from 1996-97) their savings income which took their taxable income above the lower rate limit, and such income was chargeable to tax at the lower rate and not the basic rate.

(2) In 1999-2000 the starting rate replaced the lower rate. Between 1999-2000 and 2007-08 taxpayers with total taxable income below the starting rate limit. From 2008-09 taxpayers with no taxable earnings and total taxable income from savings below the starting rate limit.

(3) Taxpayers with no taxable earnings and total taxable income from savings between the starting/lower rate limit and the basic rate limit and/or dividends at the 10p ordinary rate. Before 1999-2000 these taxpayers would have been classified as lower rate taxpayers.

(4) Between 1999-2000 and 2007-08 taxpayers whose total taxable income is between the starting rate limit and basic rate limit and includes income from earnings or income taxed as earnings. From 2008-09 taxpayers whose income includes earnings or other income taxed as earnings and with total taxable income below the basic rate limit.

(5) Before 2010-11 taxpayers with total taxable income above the basic rate limit. From 2010-11 taxpayers with total taxable income between the basic rate limit and the higher rate limit.

(6) Taxpayers with total taxable income above the higher rate limit.

(7) Taxpayers aged 65 years or older for men and 60 years or older for women in 2009-10. The female State Pension Age is being increased gradually from April 2010 to be equalised with the male State Pension Age by November 2018. The female State Pension Age for the purposes of this table is 60 years and 6 months in 2010-11, 61 years in 2011-12, 61 years and 6 months in 2012-13, 62 years in 2013-14 and 62.5 years in 2014-15.

(8) Projected estimates based upon the 2011-12 Survey of Personal Incomes using economic assumptions consistent with the OBR's March 2014 economic and fiscal outlook.

## 2.2 Number of individual income taxpayers by marginal rate, gender and age, by country and region (9), 1999-2000 to 2014-15

Government Office Region (GOR)							Numbers: thousands				
Year	All taxpayers	Starting (2) rate	"Savers" (3) rate	Basic (4) rate	Higher (5) rate	Additional (6) rate	Males	Females	Under 65's	65's and over	State Pension Age (7)

Table updated April 2014

### Key

. not applicable / zero

### Footnotes for tables 2.2

(a) Figures for 2008-09 tax year are not currently available.

(1) Taxpayers with total taxable income below the lower rate limit and some taxpayers whose savings and dividend income took them above the lower rate limit. From 1993-94 until 1998-99 a number of taxpayers with taxable income in excess of the lower rate limit only paid tax at the lower rate. This was because it was only their dividend income and (from 1996-97) their savings income which took their taxable income above the lower rate limit, and such income was chargeable to tax at the lower rate and not the basic rate.

(2) In 1999-2000 the starting rate replaced the lower rate. Between 1999-2000 and 2007-08 taxpayers with total taxable income below the starting rate limit. From 2008-09 taxpayers with no taxable earnings and total taxable income from savings below the starting rate limit.

(3) Taxpayers with no taxable earnings and total taxable income from savings between the starting rate limit and the basic rate limit and/or dividends at the 10p ordinary rate.

(4) Between 1999-2000 and 2007-08 taxpayers whose total taxable income is between the starting rate limit and basic rate limit and includes income from earnings or income taxed as earnings. From 2008-09 taxpayers whose income includes earnings or other income taxed as earnings and with total taxable income below the basic rate limit.

(5) Before 2010-11 taxpayers with total taxable income above the basic rate limit. From 2010-11 taxpayers with total taxable income between the basic rate limit and the higher rate limit.

(6) Taxpayers with total taxable income above the higher rate limit.

(7) Taxpayers aged 65 years or older for men and 60 years or older for women in 2009-10. The female State Pension Age is being increased gradually from April 2010 to be equalised with the male State Pension Age by November 2018. The female State Pension Age for the purposes of this table is 60 years and 6 months in 2010-11, 61 years in 2011-12, 61 years and 6 months in 2012-13, 62 years in 2013-14 and 62.5 years in 2014-15.

(8) Projected estimates based upon the 2011-12 Survey of Personal Incomes using economic assumptions consistent with the OBR's March 2014 economic and fiscal outlook.

(9) Some UK taxpayers reside abroad, or region is not known (292,000 in 2011-12). The sum of taxpayer numbers across countries and regions in Table 2.2 therefore will not match UK total shown in Table 2.1.

## 2.4 Shares of total income (before and after tax) and income tax for percentile groups, 1999-00 to 2014-15

Table updated April 2014

### Key

- negligible

. not applicable / zero

### Footnotes for table 2.6

(1) Taxpayers with no taxable earnings and total taxable income from savings below the starting rate limit.

(2) Taxpayers with no taxable earnings and total taxable income from savings between the starting rate limit and the basic rate limit and/or dividends at the 10p ordinary rate.

(3) Taxpayers with total taxable income below the basic rate limit.

(4) For 2009-10 taxpayers with total taxable income above the basic rate limit. From 2010-11 onwards taxpayers with total taxable income between the basic rate limit and the higher rate limit.

(5) Taxpayers with total taxable income above the higher rate limit.

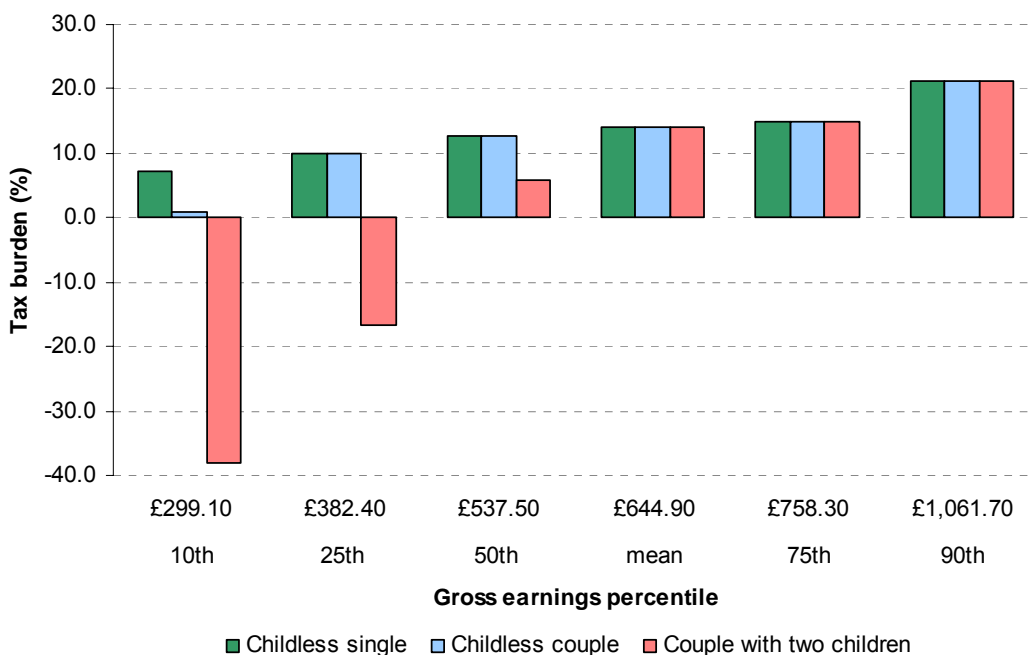

(6) In this context tax reductions refer to allowances given at a fixed rate, for example the Married Couples Allowance.

(7) Projected estimates based upon the 2011-12 Survey of Personal Incomes using economic assumptions consistent with the OBR's March 2014 economic and fiscal outlook.

## SECTION B: Illustrative tax burdens

**Table 2.7 – Income tax (net of tax credits) as a per cent of gross earnings for specimen families, 1990-91 to 2014-15:** shows how income tax burdens (tax due as per cent of gross earnings) have evolved over time for a range of illustrative families with a single wage earner at specific earnings levels across the earnings distribution. From 1999-00, income tax burdens take account of the financial support families receive in the form of tax credits, and are shown for single persons, and couples with and without children.

**Figure 6: Income tax (net of tax credits) as a per cent of gross earnings, 2014-15**

In 2012-13, the latest tax year for which earnings outturns are available, childless single persons with gross earnings at the 10<sup>th</sup> percentile of the earnings distribution had an estimated income tax burden of 9.1% of gross earnings. This increases to 13.9% at the median (50<sup>th</sup> percentile) and 20.8% at the 90<sup>th</sup> percentile. For single-earner childless couples, the tax burden is the same except for those at the 10<sup>th</sup> percentile who would still be entitled in 2012-13 to Working Tax Credit (WTC), which reduces their net income tax burden to 0.8%. Childless single people also qualify for WTC but only receive support at earnings levels below those shown in the table.

A couple with two children is eligible for WTC and Child Tax Credit (CTC). CTC extends much further up the income scale than WTC, reducing tax burdens for a couple with two children at incomes up to and including mean earnings. At the 10<sup>th</sup> percentile the amount of CTC and WTC received in 2012-13 significantly exceeds income tax liabilities due, giving a net tax burden of -39.3% of gross earnings. As the child element of tax credits is withdrawn at higher earnings levels, the difference in tax burdens for couple families with and without children

steadily falls. At mean earnings, the CTC family element only is received, reducing the income tax burden for the two child family from 14.9% to 14.5%.

Income tax burdens for childless single persons generally declined in 2012-13 compared with the previous year, by 0.4 percentage points at median earnings, and by more for lower earners. This was due to the £630 cash increase in the personal allowance to £8,105 in 2012-13. The tax burden remained at 20.8% for the illustrative high earner at the 90<sup>th</sup> earnings percentile, reflecting increased higher rate tax paid due to rising earnings against the unchanging higher rate threshold.

Changes in tax burdens in 2012-13 for single-earner childless couples were the same as those for single persons, except at the 10<sup>th</sup> earnings percentile, where reductions in WTC relative to earnings offset tax reductions to leave the net tax burden higher for childless couples. For couples with two children up to median earnings, net tax burdens fell compared with 2011-12, reflecting increases in the CTC child element. At higher earnings, however, the CTC child element is not received, and the abolition of the second income threshold in 2012-13 took families at mean earnings and above out of tax credits, adding to their net tax burden.

Projections for 2014-15 show income tax burdens declining further for most families without children, reflecting large cash increases in the personal allowance to £10,000, notwithstanding some recovery in projected earnings growth. The tax burden for single earner families without children is expected to fall by 1.1 percentage points at median earnings though, as in 2012-13, is expected to increase for the illustrative higher rate taxpayer at the 90<sup>th</sup> earnings percentile as earnings increase faster than the basic rate limit. For couples without children tax burdens likewise fall.

For lower earning families with children, net tax burdens are projected to change relatively little for families below median earnings in 2014-15, as the reduction in the income tax burden is broadly offset by the freeze in most tax credit rates in the intervening years relative to earnings. Above that level tax effects dominate so those in the mean earnings group and those in the 75<sup>th</sup> percentile group see their net tax burden fall while those in the 90<sup>th</sup> percentile see their net tax burden rise.

*Interpreting Table 2.7. Table 2.7 is different to the other tables in this release. The tax burdens are shown for hypothetical or illustrative families with given circumstances and earnings, and since 1999-00 take account of financial support received through the tax credit system. Tax credit entitlements exceed income tax liabilities in some cases leading to negative estimated tax burdens. SPI survey data is not used in constructing the table.*

*These illustrative families are not designed to represent the overall UK taxpaying population, whose family circumstances and incomes vary widely. Earnings levels assumed in the table are derived from the Office for National Statistics' Annual Survey of Hours and Earnings, with latest available outturn data for April 2013. Outturns for tax burdens therefore are published to 2012-13, with projections for 2014-15.*

Table updated April 2014

#### Footnotes for table 2.7

(1) Gross weekly earnings (Annual Survey of Hours and Earnings). Earnings are for full-time employee jobs (male and female) on adult rates with pay unaffected by absence.

(2) Married partner calculation assumes that the person is claiming the full Married Couple's Allowance.

(3) Earnings projections based on Annual Survey of Hours and Earning (ASHE) data to April 2014, and earnings growth assumptions consistent with the OBR's March 2014 economic and fiscal outlook.

## Annex A: Context and background information

### Income tax

An introduction to income tax is available on the HMRC website:

<http://www.hmrc.gov.uk/incometax/basics.htm>

Income tax is an annual tax on individuals' income arising in a given tax year (6th April to the 5th April the following year). It is the UK Government's largest single source of tax revenue, with income tax receipts net of tax credits contributing £152 billion to total current receipts of £593.4 billion in 2012-13<sup>12</sup>.

Since April 1990, the UK has had a system of independent taxation. This means that the tax liability for each taxpayer is based solely on their own income and circumstances, and the income of spouses or partners or other family members in general has no effect on the total tax paid. The exception to this is for married couples or civil partnerships that are living together where at least one spouse or partner was born before 6<sup>th</sup> April 1935, who can still claim Married Couples Allowance (MCA).

Most sources of income are liable for income tax including earnings from employment and from self-employment, most pensions income (state, occupational and personal), interest on most savings, income from shares (dividends), rental income and income paid from trusts, and some social security benefits. Employees who receive non-cash benefits from their employers such as company cars, fuel, medical insurance, living accommodation or loans also pay tax on these benefits. Adding all these sources together will give an individual's total income assessable for tax, an aggregate that appears in several ITLS tables.

Some sources of income are not liable for tax including certain social security benefits, Child and Working Tax Credits, and income from tax exempt savings accounts (e.g. Individual Savings Accounts and some National Savings & Investment products): <http://www.hmrc.gov.uk/incometax/taxable-income.htm>

Most individuals resident in the UK for tax purposes receive a tax free or 'personal allowance' (PA), which is an amount of income they can receive each year tax-free. In 2014-15, the basic PA is £10,000 for individuals born after 5 April 1948. Individuals born between 6 April 1938 and 5 April 1948 (previously 65-74 year olds), and born before 6 April 1938 (previously those 75 and over) receive higher allowances (£10,500 and £10,660 respectively), although these are reduced by £1 for every £2 above the income limit of £27,000. All individuals, regardless of age, with an income above £100,000 have their allowance reduced by £1 for every £2 of the excess until it is withdrawn completely. People who are registered as blind in England and Wales, or who in Scotland and Northern Ireland cannot do any work for which eyesight is essential, can claim Blind Person's Allowance.

---

<sup>12</sup> Office for Budget Responsibility's Economic and Fiscal Outlook, March 2014, table 4.5: <http://cdn.budgetresponsibility.org.uk/37839-OBR-Cm-8820-accessible-web-v2.pdf>

Income tax is due only on taxable income above an individual's personal allowance. Even then, there are other reliefs and allowances that can reduce an individual's tax bill. Tax reliefs are available on contributions to pension schemes and donations to charities. Employees and Directors may also receive tax relief on business expenses they have paid for. There are other allowances and reliefs that can reduce tax bills such as MCA described above. Unlike personal allowances, these are not amounts of income that can be received tax-free; rather they are amounts that may be deducted from any tax bill due.

Once tax-free allowances have been taken into account, income tax due is calculated using different tax rates for specific types of income across a series of tax bands. There are three different sources of income for tax purposes:

- income other than savings and dividends, often referred to informally as "earnings", which includes earnings from employment, but also profits from self-employment, pension income, taxable benefits and rental income.
- savings income (e.g. bank and building society interest)
- dividends (e.g. income from shares in UK companies)

These sources are taxed at one of the main rates of income tax shown in the table below (the basic rate, the higher rate and, from 2010-11, the additional rate). Income tax works on a 'stack' basis. This means that earnings are taxed first, then savings and finally dividend income is taxed last. This means, for example, that if an individual has earnings after allowances sufficient to completely fill the basic rate tax band, all savings or dividends income would be charged at the higher (or additional) rates of tax.

**Income tax rates 2014-15 by type of income and tax band**

Source	Starting rate for savings <sup>1</sup>	Basic rate	Higher rate	Additional rate
Taxable income after allowances	£0 - £2,880	£0 - £31,865	£31,866 - £150,000	More than £150,000
Earnings <sup>2</sup>	-	20%	40%	45%
Savings	10%	20%	40%	45%
Dividends <sup>3</sup>	-	10%	32.5%	37.5%

<sup>1</sup> The starting rate for savings is a special rate of tax for savings income only. It is only available to the extent that the individual's taxable income from earnings does not exceed the starting rate limit.

<sup>2</sup> Includes all taxable income not defined as savings or dividend income.

<sup>3</sup> Dividends are paid with a non-reclaimable 10 per cent tax credit that satisfies the 10% liability for dividends.

Note that a non-reclaimable dividend tax credit exists that satisfies the 10% tax liability due on grossed dividends at the basic rate (or 10% of liabilities due on dividends at higher rates). In that sense, tax rates effectively paid by individuals themselves are lower than shown in the table above (e.g. 0% for grossed dividends in the basic rate band). Irrespective of how such liabilities are satisfied, liabilities on dividends at 10% or higher rates still arise for all individuals with dividends income exceeding the personal allowance. For this reason, in this release statistics on individuals' dividends tax and therefore total tax liabilities, in turn partly determining estimated taxpayer numbers, are compiled on a "liabilities basis", i.e. gross of (i.e. before) the dividends tax credit discussed above.

A series of example tax calculations using 2014-15 rates and allowances are provided below.

**Table 1: Examples of tax liability calculations for 2014-15<sup>1</sup>**

Liabilities rounded to nearest whole £

<b>Example 1: Individual born after 6 April 1948 with earnings only</b>

<sup>1</sup> Dividends liabilities are shown gross of the 10% dividends tax credit that covers the first 10% of tax due on dividends income for all taxpayers

The way income tax is collected depends both on the type of the income and circumstances of the taxpayer. For most taxpayers, income tax on employment income or occupational pensions is collected through PAYE where income tax is calculated and deducted from the taxpayer's pay or pension before being paid over directly to HMRC by the employer or pension provider. Tax on savings income is usually deducted at source by banks or building societies at the basic rate, with additional income tax due for higher and additional rate taxpayers being collected either through PAYE via a change in their tax code or through SA.

Various categories of taxpayers including those with total income above £100,000, or income from savings, investments and property above a certain level, the self-employed, company directors and others with more complex tax affairs pay income tax due through Self Assessment (SA):

<http://www.hmrc.gov.uk/sa/need-tax-return.htm>

There are lags between when taxes collected through SA are received and when the corresponding tax liabilities arise. This is because the majority of tax collected through SA is not usually paid until the year after the liability arises.

## **Recent changes to income tax**

The personal allowance and most income tax limits are statutorily increased each tax year with the annual increase in the Retail Price Index (RPI) for September in the previous year ('indexation'). The Government may also legislate to introduce other changes to allowances and limits to over-ride indexation, or to introduce changes to income tax rates and structures.

Details of current and historic income tax allowances and rates are published on the HMRC website: <http://www.hmrc.gov.uk/statistics/tax-structure.htm>

The main income tax changes over recent years can be summarised as follows.

### **2008-09**

- The basic rate of income tax was reduced from 22% to 20% and the 20% savings rate was abolished. The 10% starting rate was removed except for savings income.
- The personal allowance was increased by £600 above indexation, and the personal allowances for those aged 65-74 and 75 and over were increased by £1,180 above indexation. The basic rate limit was reduced by £1,200 after indexation.

### **2009-10**

- The personal allowance was increased by £130 above indexation and the basic rate limit was increased by £800 above indexation.

### **2010-11**

- All existing allowances and limits remained at their 2009-10 levels, reflecting the annual change in the RPI being negative in the previous September.
- Additionally, two changes to the structure of income tax came into effect: the first was the introduction of a new tax rate, the additional tax rate, set at 50% for taxable income over £150,000 (42.5% for dividends); the second reduces the personal allowance by £1 for every £2 of taxable income above £100,000 until fully withdrawn, regardless of the individual's age.

### **2011-12**

- The personal allowance for those aged under 65 was increased by £1,000 in cash terms (£690 above indexation) and the basic rate limit was reduced by £2,400 in cash terms, leading to a £1,400 decrease in the higher rate threshold.
- The pension tax relief annual allowance was reduced from £255,000 to £50,000 in April 2011 (and the lifetime allowance falls from £1.8m to £1.5m from April 2012). These measures replaced a previously announced policy of restricting pensions relief for those with incomes of £150,000 and over.

## **2012-13**

- In 2012-13, the personal allowance for those aged under 65 was increased by £630 in cash terms (£210 above indexation) and the basic rate limit was reduced by the same amount, implying no change in the higher rate threshold.

Note that the High Income Child Benefit charge applicable from 7 January 2013 is not included in the ITLS projections for 2012-13 or 2013-14

## **2013-14**

- In 2013-14, the personal allowance for those born after 6 April 1948 (previously those aged under 65) was increased by £1,335 in cash terms (£1,115 above indexation). The basic rate limit was reduced by £2,360 to £32,010. This reduction in the basic rate limit over and above the rise in the personal allowance has the effect of restricting the gains made by higher-rate taxpayers to a lower level than those made by basic-rate taxpayers.
- The age-related personal allowances were frozen at 2012-13 levels so that the aged personal allowance for those born between 6 April 1948 and 5 April 1938 (previously those aged 65-74) remained at £10,500 while the aged personal allowance for those born before 6 April 1938 (previously those aged 75 and over) remained at £10,660.
- The additional rate of income tax for earnings and savings was reduced from 50% to 45% while the additional rate for dividend income was reduced from 42.5% to 37.5%.

## **2014-15**

- In 2014-15, the personal allowance for those born after 6 April 1948 (previously those aged under 65) was increased by £560 in cash terms (£260 above indexation). The basic rate limit was reduced by £145 to £31,865 since the higher-rate threshold is subject to a 1% growth cap in 2014-15.
- The age-related personal allowances were frozen at 2013-14 levels so that the aged personal allowance for those born between 6 April 1948 and 5 April 1938 (previously those aged 65-74) remained at £10,500 while the aged personal allowance for those born before 6 April 1938 (previously those aged 75 and over) remained at £10,660.

## **Annex B: Data sources and Methodology**

Annex B first describes the data sources and methods used to compile statistics on the number of taxpayers and income tax liabilities shown in Tables 2.1 to 2.6 of this release.

The methods used to compile estimates of the percentage of earnings paid in income tax by individuals at specific income levels (Table 2.7) are quite distinct, and described in a later section.

### **A Tables 2.1 to 2.6**

#### **Data sources and sampling**

The published estimates of the number of persons in the UK with positive income tax liabilities (“income taxpayers”) and the magnitude of those tax liabilities are based on HMRC’s Survey of Personal Incomes (SPI).

The SPI is a sample survey of the tax records held by HMRC for individuals in the PAYE, SA and repayment claims administrative systems. The survey is conducted annually, and consists of a different sample of individuals each tax year. For each individual in the sample, SPI includes information on incomes assessable to income tax together with some basic information on individual characteristics, for example age and gender. As described below, the survey data is used to estimate income tax liabilities arising on incomes in a given tax year for each individual in the SPI sample, these amounts summarised in Tables 2.1 to 2.6 of this release.

The SPI sample totalled 690,000 individual records in 2011-12, the latest available, representing an approximate 1½ per cent sample overall of individuals in contact with HMRC, and is made up of three separate samples drawn from the following HMRC administrative systems:

- National Insurance and PAYE Service (NPS): covering all employees and recipients of occupational or personal pensions with a PAYE record.
- Computerised Environment for Self Assessment (CESA): covering the SA population which includes individuals with self-employment, rental, or untaxed investment income, as well as company directors and individuals with high incomes or complex tax affairs.
- Claims: covering persons without NPS or CESA records who have had too much tax deducted on incomes at source (e.g. on savings income) and claim a repayment from HMRC.

Some individuals with a PAYE record are also in the SA system. These individuals are excluded from the PAYE population prior to sampling, as their SA record provides a more complete picture of their taxable income. Separate

samples were drawn from each of these systems and different sampling strategies were used for each. The samples were structured as follows:

- The PAYE population from NPS was stratified by gender and by the sum of pay plus occupational pension income for the previous tax year. Where no previous year's income was available cases were stratified by gender and by whether they were a higher rate or additional rate taxpayer for the current tax year based on information available at the time the sample was drawn. The sampling fractions varied from 1 in 10 for individuals with high incomes and rare allowances to about 1 in 200 for people with low combined pay and pensions. In all, about 403,000 individuals were selected from NPS for inclusion in the 2011-12 SPI.
- For the SA population from CESA, the main source of income (self employment or employment/occupational pension) and ranges of income and tax were used to stratify the sample, with the sampling fraction varying from 1 in 1 for cases with very high income or tax up to about 1 in 200 for employees and occupational pensioners with smaller income or tax for 2011-12. In all, about 277,000 individuals were selected from SA for inclusion in the 2011-12 SPI.
- For claims cases, a random sample of about 1 in 20 was selected for inclusion in the SPI. This led to around 10,500 cases being selected for the survey.

The stratified SPI sample design purposely yields very large sub-samples of SPI cases with very high incomes who account for a large proportion of total liabilities, increasing the precision of estimates of tax liabilities and taxable incomes. Once data was collected for the three constituent parts of the sample, the data sets were joined together. After allowing for incomplete records and records that failed data validation tests, there were about 690,000 valid cases on the 2011-12 final SPI file.

## **Coverage of SPI and imputation of missing data items**

Not all of the individuals in the SPI sample are taxpayers. About 20 per cent of sample cases (32 per cent grossed) have no income tax liability because allowances, deductions and reliefs exceed their total income assessable for tax. Where income exceeds the threshold for the operation of PAYE, the SPI provides the most comprehensive and accurate official source of data on personal incomes assessable for income tax.

However, as HMRC does not hold information for all people with personal incomes below this level, the SPI is not a representative data source for this part of the population and no attempt has been made to estimate the number of cases below the tax threshold or the amount of their incomes. Therefore the statistics in this publication only cover individuals liable to UK income tax (taxpayers) and their incomes, and the lowest level of total income in any of these tables is the personal allowance (£7,475 in 2011-12).

The coverage of investment income for the sample drawn from NPS is incomplete. This is because HMRC does not need information on interest from which tax has been deducted at source nor dividends and associated tax credit to operate the PAYE system for most individuals. In order to create a full picture of total income for this survey, it is necessary to impute values of bank and building society interest and dividends to some sample cases.

For interest and dividends imputation, the amount for each SPI case:

- is known for cases in Self Assessment from the amount declared on the Self Assessment Return
- can be inferred or estimated reasonably for NPS cases where there is an adjustment to the tax code for higher rate taxpayers
- is supplemented with information from interest paying institutions
- is unknown for NPS cases where there is no coding adjustment - typically those with no liabilities at the higher rate of tax.

Where no information at case level is available from HMRC administrative systems, estimated values are imputed to cases so that the population as a whole has amounts consistent with evidence from other sources (for example, amounts of tax accounted for by deposit takers or indicated by household surveys).

For interest income, starting from control totals at UK level, for the number of cases with interest and the total amount of that interest, the numbers of cases and amounts of interest in Self Assessment cases and those NPS cases with coding adjustments are deducted to leave targets for the remainder of the taxpayer population. These targets are at UK level – no attempt is made to control the targets to sub-UK geographical units. The cases to which amounts are attached by the imputation process and the amounts attached are determined by probabilistic methods with just the UK targets and distributions in mind.

For dividends income, the number of non SA cases with dividends income and distribution of imputed amounts were inferred from Family Resources Survey data for 2011-12.

As with investment income, HMRC does not have complete information about superannuation or personal pension contributions. Under PAYE, tax is paid on pay after the deduction of superannuation contributions and therefore HMRC does not need to record the contributions deducted from gross pay. For a small proportion of individuals, the superannuation contribution has been taken directly from an end of year return submitted by employers. For most others, their total amount of superannuation contributions has been imputed and has been distributed among earners in the SPI sample, based on information from the Annual Survey of Hours and Earnings produced by the Office for National Statistics. The imputation of superannuation contributions has been improved using P14 employer returns data to identify probable superannuation contributions (as P14s contain information on income subject to tax and income subject to NICs, and superannuation contributions are only subject to NICs).

Relief at basic rate is given at source for employee contributions to personal pensions. As this is the correct amount of relief for basic rate taxpayer

employees, HMRC does not need to collect personal pensions data for this group of taxpayers. To compile complete estimates for personal pensions and total income for the SPI, a significant proportion of the amount of personal pension contributions has been imputed using data from external data sources. The estimated value for this and for superannuation contributions has been combined with other pensions reliefs and included in these statistics.

## **Methods for modelling income tax liabilities**

Numbers of taxpayers, total income tax liabilities, and the distributions of income tax liabilities shown in Tables 2.1 to 2.6 are estimated using HMRC's Personal Tax Model (PTM).

PTM is a microsimulation model of the UK income tax system. 'Microsimulation' denotes modelling of tax with reference to individual case level data, in this context the large sample of individuals within the SPI. For each sample case, PTM models income tax liabilities due in a given tax year based on the main features and parameters of the income tax system applying in that year, and incomes assessable for tax recorded in SPI.

Annex A provides a brief summary of how tax liabilities are calculated. An overview of the PTM modelling process applied to each SPI sample case is given below.

- Step 1: "Total income" is summed across the various components of income assessable for tax recorded or imputed in SPI, with separate sub-totals for "earnings" (comprising all incomes taxed like earnings), savings and dividends.
- Step 2: "Income after deductions" is calculated by PTM as total income less contributions to occupational and private pensions and charities. This approach implies 100% tax relief on such contributions, consistent with the overall exchequer effects.<sup>13</sup> PTM deducts pension contributions and contributions to charities from earnings income first, then savings then dividends income.
- Step 3: PTM calculates personal allowances, initially on the basis of an individual's age, and with blind person's allowance allocated where applicable. PTM's final assessment of personal allowances takes account of the excess of income after deductions over the aged income limit for SPI cases aged 65 and over (replaced by those born before 6 April 1948 from 2013-14) and, from 2011-12, the excess of income after deductions over £100,000 for all SPI cases.
- Step 4: The resulting allowance is allocated first to earnings, then savings and then dividends incomes (after deductions) in order to derive sub-totals for "taxable income".

---

<sup>13</sup> For charitable donations, basic rate income tax is given by means of a repayment of the tax by HMRC to the charity receiving the donation. Any relief at the higher or additional rate is claimed by the individual donor.

- Step 5: Taxable incomes are allocated to the starting, basic, higher and, from 2010-11, additional rate tax bands beginning with taxable earnings, then savings, and then dividends, with corresponding gross tax liabilities in each category found by applying the corresponding rate of income tax.
- Step 6: The resulting total for income tax liabilities is adjusted to take account of other allowances given as income tax reductions (sometimes called “tax credits”). PTM takes the following such allowances into account: Married Couples Allowance, Maintenance Payments Relief, Community Investment Tax relief, Venture Capital Trust Relief and Enterprise Investment Scheme Relief.

As with similar models of personal taxes and benefits, it is neither possible nor practical to incorporate all of the detailed features of the UK income tax system into the PTM modelling process. For example, the list of deductions and allowances built into the PTM modelling process at steps 2-6 is not exhaustive, but does cover the most significant income tax reliefs by value.

### **Taxpayers and taxpayer marginal rates**

SPI sample cases with PTM modelled tax liabilities greater than zero are classified as income taxpayers and underpin the analyses of numbers of taxpayers shown in Tables 2.1 and 2.2. PTM further classifies taxpayers by their highest marginal rate of tax, as seen in Tables 2.1, 2.2, 2.5 and 2.6.

In practice, the marginal rate of tax an individual will pay on an additional pound of income will depend on what type of income it is, as well as the total and composition of their other taxable incomes. For example, an individual with earnings only within the basic rate tax band would face a marginal rate of 20% on an additional pound of earnings in 2011-12; the same rate would apply to an extra pound of savings, whereas a 10% rate would apply for dividends in 2011-12.

PTM adopts a simplified and strictly ordered method in allocating marginal rates to SPI sample cases:

- From 2010-11, cases with total taxable income above the higher rate limit (£150,000) are classified as additional rate taxpayers.
- Cases with total taxable income above the basic rate limit are classified as higher rate taxpayers.
- Remaining cases with non-zero total taxable income lying at or below the basic rate limit are classified as either starting, savers or basic rate taxpayers according to the make-up of their total taxable income:
  - Those with any taxable earnings are classified as basic rate taxpayers.
  - Those without taxable earnings, and with taxable savings only below the starting rate limit for savings income are classified as starting rate taxpayers.
  - Those without taxable earnings, and with taxable savings exceeding the starting rate limit or taxable dividends, are classified as “savers” rate taxpayers.

- Note that this marginal rate classification does not take account of the impact of allowances given as tax reductions (Step 6 of modelling process above). For example, an SPI case with taxable earnings only just above the basic rate limit may have tax reductions sufficient to eliminate any higher rate liabilities, and would be classified as a basic rate taxpayer.

This ITLS classification has changed over time reflecting the changing structure of the income tax system. The allocation described above applies from 2008-09, when the starting rate of tax was removed for earnings income.

For 2007-08 and earlier, all SPI cases with taxable earnings/savings income below the starting rate limit were classified as starting rate taxpayers. Those with taxable earnings/savings between the starting and basic rate limits were classified either at savers rate (i.e. those without earnings charged at the then basic rate of 22%) or basic rate otherwise. Individuals with taxable dividends only below the basic rate limit were classified at savers rate.

Informally, all individuals classified by PTM as either starting, savers and basic rate taxpayers may all be viewed as “non higher rate” taxpayers in the sense that their total taxable income is less than the basic rate limit, and so no tax liabilities are due at higher or additional rates of tax.

Tables 2.1, 2.2, 2.5 and 2.6 are presented in their current format to provide additional information showing these different types of non higher rate taxpayer, but some users may prefer to group together these categories depending on context and purpose; in a time-series context for example, this grouping is helpful in abstracting from those step changes in numbers assigned to each sub-category that have arisen directly as a result of changes to the structure of the income tax system.

## **Projections**

Due to the time needed to receive and process tax returns and information provided by employers, SPI survey results are not available until several years after the tax year to which the survey data relate. The latest available SPI survey data is for 2011-12, and was first published in January 2014.

Projections up to the current tax year, 2014-15, therefore are also given in tables 2.1 to 2.6 in order to provide a more up-to-date assessment of the distributions for taxpayers and liabilities. While the projections methods aim to capture where possible the most important likely influences on taxpayer numbers and liabilities, projection of the base SPI survey data to later years inevitably means that these projections are subject to greater uncertainties and potential error margins than outturns for 2011-12 and earlier years (see Annex C).

The projections methods described below have been chosen to suit the ITLS statistics key purpose of providing informative breakdowns of income taxpayers and liabilities. Provision of projections of total tax is not a key purpose of the ITLS release, and use of other data sources and alternative projection methods would be required to make them suitable for that particular purpose. They should not be

seen or used as alternative or competitor forecasts of income tax produced by other organisations.

**Potential taxpayer numbers** in the projections years are projected via a re-scaling of the SPI base year grossing factors for individual SPI sample cases, according to a high level partition of the SPI sample by each case's main income source:

- main source employment and self-employment income cases are first projected/re-scaled according to published Office for National Statistics (ONS) population projections by single year of age (implying initially constant employment and self-employment rates by age band). Grossing factors are then further re-scaled uniformly across all age bands so that grossed SPI main source employment and self-employment case totals change in percentage terms from 2011-12 in line with the OBR's most recently published forecast for total employment and self-employment (Labour Force Survey definitions).
- remaining SPI cases are projected/re-scaled uniformly according to the implied percentage change in the residual main source "other" category, calculated as difference between the published ONS population total and projected SPI main source employed and self-employed totals derived as described immediately above.
- this process is applied separately for males and females.

**Nominal income amounts** recorded in the base SPI survey data for each case are projected at the UK level using OBR's most recently published forecasts for a range of macroeconomic series relevant to the specific income sources recorded in SPI. For each income source, this uprating is generally uniform across all sample cases. However, in the case of pay/earnings, the projection factors are allowed to vary across the pay distribution according to the recent trends revealed in the ONS Annual Survey of Hours and Earnings (ASHE):

- SPI cases are assigned to one of six quantile groups, partitioned according to percentiles P10, P25, P75, P90 and P95 of the ASHE weekly pay distribution.
- Earnings growth for cases in the 'middle group' (P25-P75) is projected according to the OBR forecast for whole economy average earnings growth.
- For other groups, average earnings growth is adjusted according to the deviation (ratio) of implied average earnings growth over the past seven years at the relevant ASHE percentile relative to mean ASHE earnings growth. For example, earnings growth for those in the bottom group (below P10) is adjusted according to average growth at ASHE P10 relative to the ASHE mean.

Again, this process is applied separately for males and females. Since these ASHE and SPI samples are different, it should be clear that resulting mean earnings growth across all SPI cases would differ from the OBR forecast; a further re-scaling is applied to all cases to ensure that mean earnings growth does align with the OBR forecast.

Table 2 below summarises which assumptions/series are used in the ITLS projections processes for re-scaling of grossing factors and nominal incomes.

**Table 2: Summary of economic assumptions used in ITLS projections**

<b>SPI population totals:</b>	<b>SPI taxpayer total 2011-12 £ billion</b>	<b>Series used in projections</b>
Main source employed	-	Population by single year age; and total employees (LFS)
Main source self employed	-	Population by single year age; and total self-employment (LFS)
Main source other	-	Population by single year age
<b>Main income components:</b>		
Pay	622	Implied whole economy average earnings (Wages and salaries divided by LFS employees), with allowance for differential growth across distribution (see main text)
Profits	80.1	Total self-employed (mixed) income
Personal pension income	73.8	Weighted average Retail Prices Index and whole economy average earnings
Dividends	42.5	Household and Non-profit institutions serving households dividend receipts
State pension income	39.1	Announced rates
Bank & building society interest	7.4	Household bank & building society deposits multiplied by weighted average of building society deposit and 5-year rates
Property income	12.1	Retail Prices Index
Taxable employer benefits	8.6	Retail Prices Index

The economic series used in the projection processes are consistent with the most recently published OBR forecast for the UK economy. Note that because ITLS projections are provided only to the current tax year, these economic series mainly consist of economic outturns published by other organisations, usually ONS. The OBR forecasts for these series are typically relevant only for the ITLS projections for tax year 2014-15, where economic outturns for most series are not yet available.

The projections in the April 2014 release of ITLS use economic series consistent with the OBR's March 2014 *Economic and fiscal outlook*. Outturns and OBR forecasts for key series including employment, earnings, prices and interest rates are published by the OBR (Table 4.1 'Determinants of the fiscal forecast'): [http://budgetresponsibility.org.uk/wordpress/docs/March\\_2014\\_EFO\\_Charts\\_and\\_Tables.xls](http://budgetresponsibility.org.uk/wordpress/docs/March_2014_EFO_Charts_and_Tables.xls)

The OBR's release policy for supplementary forecast information is available here: [http://budgetresponsibility.independent.gov.uk/wordpress/docs/release\\_policy.pdf](http://budgetresponsibility.independent.gov.uk/wordpress/docs/release_policy.pdf)

Population projections used in this ITLS release are published by ONS (Table A3-1 'Principal projection - UK population single year of age'):

<http://www.ons.gov.uk/ons/rel/npp/national-population-projections/2012-based-projections/rft-table-a3-1-principal-projection---uk-population-single-year-of-age.xls>

**Projections of incomes for high earners** for 2012-13 and 2013-14 also allow for possible behavioural responses following the introduction of the additional rate of tax in April 2010 and the reduction in the rate from 50% to 45% in April 2013. Specifically, these responses are: (a) continued temporary reductions in incomes below 'normal' levels for those affected during 2012-13, the counterpart of significant forestalling of incomes in 2009-10 ahead of the introduction of the additional rate; and (b) possible anticipatory effects in 2012-13 and their subsequent counterpart in 2013-14 that may arise in advance of the reduction in the additional rate of tax to 45%. 2014-15 is likely to be the first year to be relatively unaffected by timing effects due to the changes in the additional rate of income tax in the recent series. The projections to this year are, however, still influenced by the uncertainties regarding the extent of unwinding of forestalling in the base year.

Separate to the ITLS statistics, in March 2012 HMRC published a comprehensive ex-post assessment of the 50% additional rate of income tax using a range of evidence including 2010-11 SA returns:

<http://www.hmrc.gov.uk/budget2012/excheq-income-tax-2042.pdf>

Forestalling of incomes in 2009-10 was estimated at £16-18 billion in total, together with significant temporary reductions in incomes for those affected in later years (but especially in 2010-11). While these assessments are subject to significant uncertainties, unadjusted projections of the outturn SPI 2011-12 survey data therefore would be likely to lead to significant under-prediction of incomes for high earners and associated liabilities in later years.

Consistent with the published report the ITLS projections for 2012-13 and 2013-14 therefore allow for:

- a gradual recovery in incomes back towards 'normal' levels from their 2010-11 outturn, which is assumed to be especially depressed by incomes brought forward to 2009-10. Forestalling in 2009-10 was assumed to be split equally between pay and dividends, with unwinding concentrated in 2010-11 for forestalled pay, but split more equally across the three tax years to 2012-13 for dividends; and
- temporary reductions in incomes totalling around £5¼ billion in 2012-13, representing income deferrals to 2013-14, ahead of the reduction in the additional rate in 2013-14.
- temporarily elevated incomes totalling £5¼ billion in 2013-14 representing the counterpart of the 2012-13 deferrals following the reduction in the additional rate.

Ignoring temporary forestalling effects, underlying behavioural responses to the introduction of the additional rate in April 2010 are assumed to be captured in the 2011-12 SPI survey data; and underlying responses to the reduction in the additional rate to 45% will occur only from 2013-14 when the rate is reduced.

The projection adjustments are applied to most SPI cases with income above £150,000. The degree of forestalling/unwinding is assumed to increase by broad income band, consistent also with the evidence from 2010-11 SA returns.

These adjustments have a significant impact on ITLS projections of the incomes and tax liabilities of taxpayers with total income above £150,000 from 2012-13, compared with the 2011-12 SPI outturn. For example, shares of income and tax accounted for by the top 1% of taxpayer by income (Table 2.4) are projected to fall slightly in 2012-13 as incomes are deferred to benefit from the reduction in the additional rate to 45% before rising strongly in 2013-14 as the deferral is unwound.

HMRC's definitive assessment of the yield arising from the introduction of the additional rate in 2010-11 is set out in the published report on the 50p rate. It is not possible to infer the additional yield arising from the 50p rate using ITLS Table 2.6, as this gives no indication of reductions in income and yield arising due to behavioural responses.

**Income tax structures, rates, allowances and thresholds** have been announced up to and including the current tax year 2013-14. No projection methods or assumptions are therefore required for this aspect of the modelling process for projections years.

For all projection years, income tax liabilities are modelled as described earlier with respect to re-grossed and uprated SPI dataset, and announced tax rates, allowances and thresholds.

## **B Table 2.7**

### **Introduction**

Table 2.7 "Percentage of earnings paid in income tax" depicts income tax burdens over time for a selection of specific family types and illustrative earnings levels.

The purpose and therefore methods underpinning Table 2.7 are quite distinct from Tables 2.1 to 2.6. The statistics in Table 2.7 do not relate to actual UK taxpayers, nor any particular subset of UK taxpayers, but rather hypothetical families assuming specific family circumstances (e.g. concerning numbers of children) and gross wages. Family circumstances and earnings in all cases are by assumption, and SPI data is not used in the calculations. The family types depicted are illustrative but far from exhaustive; circumstances and incomes in practice vary widely across families in the UK.

Table 2.7 also differs from the other tables in this release by taking account of the amounts of personal tax credits (Working Tax Credit and Child Tax Credit) the depicted families would be entitled to. These tax credits provide financial support to working families and families with children, based on family circumstances including hours worked, family income, claimant's age, the number and age of children and childcare costs.

An introduction to the tax credit system is published alongside HMRC's regularly published tax credit statistics:

<http://www.hmrc.gov.uk/statistics/personal-tax-credits.htm>

## Methods

Gross income tax liabilities and tax credit entitlements are calculated for each family in each tax year assuming specific family circumstances and the presence of a single wage earner with gross earnings at specified points in the earnings distribution.

The family types depicted in Table 2.7 have changed over time, reflecting changes to the systems, including the introduction of tax credits in 1999-00, abolition of Married Couples Allowance for all born after 6<sup>th</sup> April 1935, and reforms to the tax credits system in April 2003. Since 2003-04, income tax burdens are presented for single adult families without children, couple families without children, and couples with two children.

The income tax calculations assume that:

- the taxable income of the wage earner consists only of the specified gross earnings; and that the partner in couples is a non taxpayer.
- the wage earner is entitled only to the personal allowance for under 65s, and has no deductions (e.g. pension contributions) or other allowances (e.g. blind persons allowance) reducing gross tax liabilities.

The tax credit calculations assume that:

- wage earners work full-time (>30 hours per week) and so are entitled to Working Tax Credit (WTC), including the couple element where applicable, and the WTC 30 hour element whatever their family circumstances or earnings.
- the family with two children is entitled to the Child Tax Credit (CTC) family premium and per child element; and does not receive any support through WTC for childcare costs.
- the final (tapered) tax credit award is based on a family income that consists solely of the gross earnings of the wage earner.

Calculations for each tax year are based on the prevailing structure and parameters of the income tax and tax credit systems. Table 2.7 shows income tax net of tax credits entitlements, and expressed as a percentage of gross earnings. In some cases, calculated tax credit entitlements exceed income tax liabilities, leading to a negative estimate of tax overall as a per cent of income.

## Data

Earnings at the specified points in the earnings distributions are based on the Office for National Statistics Annual Survey of Hours and Earnings (ASHE):

<http://www.ons.gov.uk/ons/rel/ashe/annual-survey-of-hours-and-earnings/2013-provisional-results/index.html>

The specific ASHE-based earnings percentiles used in Table 2.7 relate to gross weekly pay for full-time employee jobs (ASHE Table 1-1a), on an annualised basis. ASHE is published annually with an April reference period. Figures for tax years are derived by HMRC as an average of the ASHE results for the adjacent Aprils.

## **Projections**

The most recently published ASHE results are for April 2013, published on 12 December 2013, permitting derivation of estimates of earnings across the distribution up to tax year 2012-13.

Projections of income tax burdens are also provided for 2014-15. Earnings are projected to grow uniformly across the earnings distribution according to the OBR's March 2014 forecast for whole economy earnings growth.

## Annex C: Quality indicators

A quality report covering the ITLS statistics and projections is available from the National and Official Statistics section of the HMRC website:

<http://www.hmrc.gov.uk/statistics/quality/income-tax-liabilities.pdf>

This report, last updated in January 2013, assesses the statistics against standard dimensions of quality such as relevance, accuracy and reliability, timeliness and punctuality, accessibility and clarity, and coherence and comparability.

This Annex provides an annual update on quality, and provides more detailed summary quality indicators, in particular summarising the accuracy and reliability of ITLS statistics and projections. It also contains further information on the relevance and appropriate use of the statistics.

### Accuracy and Reliability

#### *Sampling error*

The SPI sample is compiled in order to infer results for the UK taxpaying population as a whole, e.g. the number of such taxpayers and their total tax liabilities. As with all sample surveys, estimates from the SPI are subject to sampling variation meaning estimated totals and other sample statistics would vary from one sample to the next if repeated random samples were drawn, and in all cases would differ to some degree from the corresponding population totals purely by chance. Intuitively, the extent of such variation increases with the degree of variation across the population in the variable of interest (e.g. income tax liabilities), and falls as the size of the sample increases.

Variation in a given sample-based statistic is usually measured by its standard error, which represents the standard deviation of the statistic of interest computed across all possible samples that could have been drawn from the population. Based on the standard errors, the precision of sample estimates is typically illustrated through confidence intervals, which provide an estimated range of values which is likely to include the unknown population parameter with a given level of confidence.

95% confidence intervals for SPI-based estimates of the number of UK income taxpayers and total tax liabilities by region and county in 2011-12, together with a range of other variables, are published in HMRC Table 3.13a:

[https://www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/284786/tables3-12\\_3-15a.pdf](https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/284786/tables3-12_3-15a.pdf)

Key results are repeated in table 1 below. For the United Kingdom, the width of the 95% confidence intervals for numbers of taxpayers and total income tax liabilities are 100 thousand and £1 billion (0.3% and 0.6%) of the central estimates respectively). As shown in the table, precision declines for smaller estimated totals, e.g. for numbers of taxpayers and tax liabilities in specific countries and regions. Broadly speaking, as sample size changes by a factor  $x$ , the confidence interval will change by a factor  $(1/\sqrt{x})$ , so a fourfold increase in

sample size will halve the confidence interval. Confidence intervals for year-on-year changes in these quantities meanwhile may very broadly be expected to be larger than those for the annual levels shown below by a factor of around  $\sqrt{2}$ .

**Table 3: Confidence intervals for estimates of taxpayer numbers and total tax liabilities**

SPI 2011-12	Taxpayers, thousands				Income tax liabilities, £millions			
	95% CI		95% CI	CI width	95% CI		95% CI	CI width
	Lower Limit	Central estimate	Upper Limit	as % estimate	Lower Limit	Central estimate	Upper Limit	as % estimate
United Kingdom	30,700	30,800	30,800	0.3	155,000	156,000	156,000	0.6
North East	1,150	1,170	1,190	3.4	4,000	4,110	4,210	5.1
North West	3,230	3,260	3,290	1.8	12,500	12,700	12,900	3.1
Yorkshire and the Humber	2,370	2,390	2,420	2.1	8,820	8,970	9,110	3.2
East Midlands	2,140	2,170	2,190	2.3	8,390	8,540	8,700	3.6
West Midlands	2,530	2,560	2,590	2.3	9,780	9,940	10,100	3.2
East of England	2,940	2,970	3,000	2.0	15,800	16,100	16,300	3.1
London	3,920	3,950	3,980	1.5	34,500	35,000	35,400	2.6
South East	4,450	4,490	4,520	1.6	28,200	28,500	28,800	2.1
South West	2,680	2,700	2,730	1.9	10,800	11,000	11,100	2.7
Wales	1,390	1,410	1,430	2.8	4,590	4,680	4,770	3.8
Scotland	2,620	2,640	2,670	1.9	11,100	11,300	11,400	2.7
Northern Ireland	731	746	761	4.0	2,550	2,630	2,700	5.7

The 95% confidence intervals may be interpreted in one of two ways: (i) if *repeated samples* were drawn and intervals computed as in the table, those intervals would contain the unknown population parameter around 95 times in 100; or (ii) the lower and upper confidence limits provide a *plausible range* for the true population value in the sense that if that value were in reality greater[smaller] than the upper[lower] confidence limit, then the probability of obtaining a sample estimate any lower[greater] than that observed would be just 2½ per cent.

### **Coverage error**

The SPI survey is fully representative only of UK taxpayers, as opposed to the entire UK population, and so ITLS tables are published for UK taxpayers only.

Annex B also notes that for SPI sub-sample of individuals drawn from PAYE only, a number of data items are not recorded in administrative tax records because these are not needed for the operation of the income tax system. These items include, for example, savings interest income which is not recorded in PAYE because tax is deducted at source via a separate scheme operated by deposit takers. These missing data items are imputed for most SPI sample cases in PAYE only as described in the annex.

Table 2 below shows the total contribution to key SPI income aggregates from imputed values in 2011-12. Users interested in ITLS estimates and projections of tax liabilities on these particular items should note the degree of imputation. A large contribution to the estimates from imputed values is likely to lead to a loss of accuracy. Overall, imputation contributes around £20 billion (occupational pension

contributions are included in gross pay) to grossed total income across all taxpayers of £886 billion in 2011-12.

**Table 4: Extent of imputation**

SPI 2011-12 grossed totals	Number of individuals (thousands)		Total amount (£million)	
	Imputed	Total	Imputed	Total
Individuals' age	78	46,300	-	-
Bank and building society interest income	27,900	33,000	3,360	9,580
Dividends	2,410	5,650	1,610	43,000
Occupational pension contributions	8,200	8,200	14,600	14,600
Personal pension contributions	2,240	3,150	3,270	8,810

### ***Model errors***

Income tax liabilities in ITLS are estimated at case level on the basis of the SPI survey data using HMRC's Personal Tax Model (PTM). The PTM tax modelling process attempts to capture all of the significant features of the UK income tax system, but inevitably this involves certain simplifications and omissions.

PTM model outputs are regularly benchmarked at case level against income liabilities recorded as due in HMRC's SA system for the SPI sub-sample in SA. Differences arise for known and specific reasons and only in a small minority of sample cases. The impact of these simplifications is judged to be small for key aggregates at UK level, and for most UK taxpayer sub-populations.

### ***Projection errors***

Simplifications and potential errors: (a) in projection processes; and also (b) the economic assumptions employed in those processes are likely to induce larger errors in ITLS projections compared with outturn statistics for 2011-12 and earlier tax years.

Projection methods are described in Annex B. Users of the projections should note that the projection methods are suited to analysis of tax liabilities at UK level. Projection of potential taxpayer numbers and incomes by income source is based on UK economic assumptions, which are applied generally uniformly to all individuals in the SPI sample. They take no account of local divergences in economic trends since 2011-12 within the UK, or indeed across other dimensions such as industrial sector.

Published breakdowns of projected taxpayer numbers by country and region (Table 2.2) therefore are indicative, and there is some evidence that they may be subject to potentially large error margins. HMRC is reviewing the evidence, and will consider whether regional projections are suitable for continued publication.

In addition, the projections will not capture potentially important shifts in the distribution of incomes occurring after 2011-12. ITLS projected shares of total income and tax across taxpayer income groupings are therefore likewise indicative (Table 2.4), but do allow for differential growth in earnings across the pay distribution consistent with past trends, and possible responses of high income taxpayers to changes in the tax policy regime.

Summary statistics describing ex post ITLS absolute projection errors across key aggregates for projections released following spring Budgets since 2001 are shown in the table below. The forecast horizon is defined with respect to the latest SPI outturn data available, e.g. this ITLS release uses 2011-12 SPI survey data, which gives a 'one-year ahead' projection for 2012-13.

**Table 5: Summary statistics for absolute errors in ITLS projections of key aggregates<sup>1,2</sup>**

	Taxpayers thousands	Higher rate taxpayers thousands	Total income £ billion	Total liabilities £ billion
<b>One-year ahead projections (N = 10)</b>				
Mean	590	110	18	4
Max	1,400	290	40	9
Standard deviation	500	110	13	3
Mean	2%	4%	3%	3%
Max	5%	10%	7%	8%
Standard deviation	2%	4%	2%	2%
<b>Two-year ahead projections (N = 9)</b>				
Mean	840	160	30	7
Max	1,900	400	63	14
Standard deviation	520	150	19	4
Mean	3%	5%	4%	6%
Max	6%	11%	8%	10%
Standard deviation	2%	5%	3%	3%
<b>Three-year ahead projections (N = 9)</b>				
Mean	1,110	220	40	10
Max	2,300	480	84	19
Standard deviation	700	140	26	6
Mean	4%	7%	5%	7%
Max	8%	13%	10%	13%
Standard deviation	2%	4%	3%	4%
<b>Memo: Evolution of projections for 2011-12</b>				
Three-year ahead projection <sup>3</sup>	-	-	-	-
Two-year ahead projection (April 2012)	30,100	3,860	873	154
One-year ahead projection (April 2013)	30,400	3,870	884	158
SPI 2011-12 outturn	30,800	3,830	886	156

<sup>1</sup> ITLS projections released after spring Budgets since 2001.

<sup>2</sup> Projection horizon is defined by latest SPI outturn data available for analysis, e.g. one-year ahead projections are projections for tax year T+1 based on SPI data for year T. Budget projections for year T+1 are generally published at the beginning of year T+3, and so economic assumptions used in the projection process are typically outturns to around year T+2.

<sup>3</sup> Three year ahead projection for 2011-12 not published due to delay in publication of 2008-09 SPI.

The table indicates mean absolute projection errors of 2-4% for key UK aggregates in respect of the one-year ahead projections, roughly doubling for three-year ahead projections. Plus or minus one standard deviation in past errors provides one guide to the possible limits of approximate 70 per cent confidence intervals around central projections for key ITLS aggregates. However, past

errors may not accurately reflect the degree of ex ante uncertainty in projections made at any specific point in time. The table also shows the evolution of projections made for 2011-12, the latest SPI outturn.

Ex ante uncertainty in the projections may be illustrated via 'ready reckoners'. The table below shows estimated changes from the April 2014 ITLS central projections arising for illustrative increases in key economic assumptions used in the projection process. Comparable reductions in the same series would have broadly similar impacts of opposite sign.

**Table 6: Sensitivity of central projections to changes in key economic assumptions**

	<b>2011-12</b>	<b>2012-13</b>	<b>2013-14</b>	<b>2014-15</b>
	<b>outturn</b>	<b>projection</b>	<b>projection</b>	<b>projection</b>
<b>Central projection</b>				
Taxpayers	30,800	30,600	29,800	29,900
o/w non higher rate taxpayers	26,900	26,400	25,100	25,000
o/w higher/additional rate taxpayers	3,830	4,130	4,700	4,950
Total liabilities	156,000	158,000	167,000	172,000
o/w liabilities of non higher rate taxpayers	63,700	61,800	56,100	55,800
o/w liabilities of higher/additional rate taxpayers	91,900	96,300	111,000	116,000
<b>Working-age employees+1%<sup>1</sup></b>				
Taxpayers		125	128	130
o/w non higher rate taxpayers		101	100	100
o/w higher/additional rate taxpayers		24	28	30
Total liabilities		739	809	830
o/w liabilities of non higher rate taxpayers		335	305	303
o/w liabilities of higher/additional rate taxpayers		404	504	527
<b>Pay+1%<sup>2</sup></b>				
Taxpayers		61	72	63
o/w non higher rate taxpayers		-18	-11	-24
o/w higher/additional rate taxpayers		80	83	87
Total liabilities		1,840	1,960	2,020
o/w liabilities of non higher rate taxpayers		787	766	776
o/w liabilities of higher/additional rate taxpayers		1,050	1,190	1,250
<b>Profits+1%<sup>2</sup></b>				
Taxpayers		24	19	15
o/w non higher rate taxpayers		16	13	10
o/w higher/additional rate taxpayers		8	5	5
Total liabilities		265	260	263
o/w liabilities of non higher rate taxpayers		77	72	71
o/w liabilities of higher/additional rate taxpayers		188	189	191
<b>Interest rates+1ppt<sup>3</sup></b>				
Taxpayers		237	200	191
o/w non higher rate taxpayers		174	132	124
o/w higher/additional rate taxpayers		63	69	68
Total liabilities		2,320	2,300	2,440
o/w liabilities of non higher rate taxpayers		750	703	705
o/w liabilities of higher/additional rate taxpayers		1,540	1,570	1,720

<sup>1</sup> 1% point increase in numbers employed (SPI cases with pay > 0 aged 16-59) relative to central projection, holding SPI population aged 16-59 constant.

<sup>2</sup> 1% point increase in pay/profits for all SPI cases with pay/profits relative to central projection.

<sup>3</sup> 1% point increase **interest rates** on savings income relative to central projection. The resulting percentage change in savings interest income depends on the central projection for interest rates, but will generally be much larger than the +1% ready reckoners shown earlier in the table for pay/profits.

The table shows that:

- An illustrative 1 percentage point increase in working-age employment increases projected taxpayer numbers by 0.4% and tax liabilities by 0.5% in 2014-15, with increases in taxpayer numbers and liabilities at non higher and higher/additional rates reflecting the centrally projected distributions.
- An illustrative 1 percentage point increases in earnings has a larger 1.2% impact on liabilities in 2014-15, as marginal rates of tax exceed average rates (the latter relevant to the employment change). Taxpayer numbers rise by 0.2% overall, but with numbers of non-higher rate taxpayers declining a little as numbers moving into higher rate tax (from basic rate) exceed those moving into basic rate tax.
- An illustrative 1 percentage point increase in average profits raises liabilities by 0.2% in 2014-15, reflecting the much lower level of profits in total taxpayer income relative to earnings. Taxpayer numbers rise by 0.1%.
- An illustrative 1 percentage point increase in interest rates increases liabilities by 1.4% in 2014-15. Note that the percentage change in savings income resulting from a 1 percentage point increase in savings interest *rates* varies with the central projection for interest rates, but will generally be much larger than 1 percentage point ready reckoners shown for pay and profits. Taxpayer numbers rise by 0.6%.

## **Annex D: Glossary of Terms**

Annex D aims to explain acronyms, abbreviations and terms associated with personal incomes and income tax liabilities.

### **Allowances**

The amount of income which an individual can receive before being liable for income tax. The personal allowance is an example of an allowance.

### **Average rate of Tax**

The ratio of income tax liability to total income, where income is measured before deductions, reliefs and allowances.

### **Basic rate limit**

This is the highest income point for taxable income (after allowances) at which basic rate income tax is charged.

### **CESA (Computerised Environment for Self Assessment)**

This is the computer system used to administer Self Assessment from which SA data for the SPI has been extracted since 1996-97. See Self Assessment (SA).

### **COP (Computerisation of PAYE)**

The computer system which used to administer PAYE until being replaced by NPS and from which PAYE data for the SPI was extracted for tax years 1997-98 to 2007-08 inclusive.

### **Deductions and Reliefs**

Amounts deducted from total income, along with personal allowances to arrive at the amount of taxable income subject to an income tax charge. This includes amounts for contributions to occupational and personal pensions, and a variety of other Deductions and Reliefs including charitable giving and loss relief etc.

### **Dividend Income**

Income derived from shares.

### **Geographical Areas**

Some tables present information for sub-UK areas described as Government Office Region, County, District and Parliamentary Constituency. Administrative and Political geographical areas are not held on taxpayers' records. For the SPI, the areas are attached by matching the individual's postcode to the Office for National Statistics Postcode Directory.

### **Industry**

Industry categories are based on UK Standard Industrial Classification of Economic Activities 2007 (SIC2007). Income from self employment

(sole trader and partner) is assigned an industry using the nature of business text descriptions supplied on Self Assessment Returns.

### **National Insurance and PAYE System (NPS)**

NPS is the computer system HMRC uses to administer PAYE. It replaced COP and is the source of PAYE data for SPI for tax year 2008-09 onwards.

### **National Insurance Recording System 2 (NIRS2)**

This computer system is used to monitor payment of National Insurance (NI) contributions and to calculate and prove entitlement to contributory benefits. These include Job Seekers Allowance (JSA) and the National Insurance Pension. It provides contribution information to a number of government departments.

### **P14s**

Form P14 is an End of Year summary for an employment that is submitted by the employer to HMRC, showing pay, tax and NI contributions for the year. The employer provides similar information to the employee on an end of year certificate, form P60.

### **Pay As You Earn (PAYE)**

PAYE is the system used by HMRC to collect and account for income tax on earnings from employment and pensions. Income Tax and National Insurance Contributions are deducted by the employer and paid over to HMRC on behalf of the individual for each pay period.

### **Personal Allowance**

This is the amount of income you can receive for the tax year without having to pay tax on it.

### **Savings Income**

A particular class of income that includes interest on bank and building society accounts.

### **Self Assessment (SA)**

SA is a system where an individual declares their income and can calculate their own income tax due after the end of the tax year. Taxpayers included in SA can be higher earners, self-employed and taxpayers with complex tax affairs.

### **Starting rate limit/Starting rate for savings limit**

This is the highest income point for taxable income (after allowances) at which starting rate income tax is charged. From 2008-09 the starting rate was abolished for non-savings income and applied only to non-dividend savings income.

**Superannuation contributions**

These are the regular amounts paid by an employee into an employer occupational pension fund which are deducted from the employee's salary. Superannuation contributions to an authorised fund or scheme are not liable to income tax and the employer would deduct the amount of superannuation contributions from the gross pay before assessing the income tax liability through PAYE.

**Survey of Personal Incomes (SPI)**

An annual survey of individuals who could be liable for income tax derived from HMRC administrative systems holding data on persons within PAYE, SA and income tax claims.

**Tax liabilities**

The amount of income tax due on taxable income after applying tax rates to the tax base. The income tax liability for each sample case in SPI is calculated by reference to the amounts of income by type, deductions and reliefs and the tax regime parameters that apply for the year. The calculated liability for a tax year will differ from the amount of tax receipts collected in a financial year.

**Tax receipts**

The amount of income tax collected by HMRC. The SPI measures the amount of income tax liability for a tax year, but not the amount of receipts in the financial year.

**Taxable income**

Income assessable to income tax after allowances.

**Taxpayer**

An individual calculated to have a positive income tax liability for the tax year, based on the income, allowances, reliefs and deductions for the year.

**Total income**

The sum of an individual's components of income taken into account in calculating income tax. This includes earnings from employment, profits from self-employment, pension income, some social security benefits, savings income, income from shares (dividends), rental income, and income paid from trusts. It excludes:

- gains from the disposal of assets that are classified as capital gains
- interest, dividends or bonuses from tax exempt investments (for example, ISAs and National Savings & Investments Savings Certificates)
- interest and terminal bonuses from Save As You Earn Schemes
- Premium Bond, National Lottery and gambling prize winnings

It is before relief for contributions to occupational and personal pensions, other deductions and reliefs or personal allowances.

In the tax system, income is streamed into three main categories: Dividends; Savings Income (not dividends); Non-savings income as different rules apply.
