

Radon in Homes in England and Wales: 2010 Data Review

D M Rees, E J Bradley and B M R Green

ABSTRACT

This report provides a summary of approximately 480,000 radon measurements made in English and Welsh homes between 1980 and 2009. It updates a previous report issued in 2002 and complements the radon atlas of England and Wales published in 2007. Results are shown for a range of administrative areas, postcodes and NHS authorities and are accompanied by a short descriptive text. For these administrative areas, the report presents estimates of the numbers of homes at or above the Action Level of 200 becquerels per cubic metre of air. The total number of homes above the Action Level is estimated to be between 100,000 and 200,000.

1 INTRODUCTION

Radon is a naturally occurring radioactive gas that is present in all homes and is the major source of ionising radiation exposure to the UK population. For further information about the sources and properties of radon, its health effects and the UK control strategy, please consult either the general Health Protection Agency (HPA) website www.hpa.org.uk or the dedicated HPA radon website at www.ukradon.org.

This report summarises the data that HPA holds from over 480,000 radon measurements in homes in England and Wales that have been collected over many years. Results are presented in tabular format to illustrate the range and distribution of radon levels in administrative areas down to electoral ward. Where the number of measurements permits, results are also grouped using the postcode system down to sector level and by NHS strategic and primary care areas.

Estimates are presented showing the numerical distribution of homes in bands of probability of exceeding the radon Action Level and the number of homes in each area that are estimated to be at or above the Action Level.

This report complements the indicative atlas of England and Wales (Miles et al, 2007) which shows radon potential in map format and updates and replaces the data tables contained within the previous results summary (Green et al, 2002).

2 MEASUREMENTS

Radon measurements in surveys are normally made with two passive integrating detectors in each home – one in the main living area and the other in a regularly used bedroom, to reflect the parts of the home that are most occupied. The detectors are placed for three months and the individual detector results combined to reflect typical occupancy patterns and corrected for seasonal variations (Miles and Howarth, 2008) to give an estimate of the annual average for the whole home. In some homes, multiple measurements have been recorded, for example when radon remedial works are undertaken. Throughout this report, the earliest valid measurement for an address is used. The results rely on the householder placing detectors in accordance with our instructions.

The data contained within this report have been collected from various measurement programmes (Kendall 2005) conducted by HPA (and previously NRPB) from the early 1980's through to early 2009. These surveys were undertaken with the aim of finding homes with high radon levels. They were not intended to be statistically representative of large areas. The areas for targeted surveys were identified through the publication of radon maps (Lomas et al (1996), Lomas et al (1998), Green et al (2002), Miles et al (2007)). To date, only one fully representative UK survey has been undertaken. That national survey (Wrixon et al, 1988) was designed to obtain a population weighted

sample of results throughout the UK. The results from that survey remain the best estimate of the average domestic radon exposure at both national and county level.

Earlier result summaries were prepared alongside radon maps and a small number of results were excluded from these reports due to positional uncertainties and were not considered for use in mapping. Improved address databases now allow many of these results to be included in this report. This present report therefore contains a more comprehensive summary of the results than similar previous publications.

3 RESULTS

Tables 1 to 9 show the number and distribution of radon measurements in homes grouped in areas by divisions and sub-divisions of three different boundary systems. These tables show

- The total number of homes in the area
- How many homes in the area have radon measurements that have been considered in the report
- The arithmetic and geometric average of the measured radon levels in the area
- The highest individual measurement in the area
- The number of homes measured at or above the Action Level in the area

Tables 10 to 12 show information about the number of homes estimated to be in various bands of probability of exceeding the UK radon Action Level. The probability ranges reflect criteria used in HPA advice as well as those used for purposes of building control and planning radon surveys. These tables also show, as a range, the estimated number of homes in the areas that are at or above the radon Action Level.

The figure below provides a guide to the contents of the main result tables.

Table number	Contents	Notes
1	Summary data for England and Wales	Figures in all tables rounded to two or three significant figures. The average concentrations are from the 1988 UK national radon survey.
2	Summary data for rural and metropolitan counties in England	Boundaries are as defined prior to administrative changes in April 2009. Applies to tables 2, 3a – 3c, 4a – 4c and 10a – 10c.
3a	Summary data for borough, district and city councils in England	
3b	As table 3a but by unitary authority in England	
3c	As table 3a but by unitary authority in Wales	
4a	Summary data for electoral wards in borough, district and city councils in England	Only includes wards in which a minimum of 5 addresses have been measured in order to preserve confidentiality of individual results – also applies to tables 4b, 4c, 6 and 7.
4b	As table 4a but by unitary authority in England	
4c	As table 4a but by unitary authority in Wales	
5	Summary data for postcode areas in England and Wales	Postcode areas DG and TD cross the English-Scottish border. Only the English addresses are included. Applies to tables 5, 6, 7 and 11
6	Summary data for postcode districts in England and Wales	AA = Arithmetic Average, GA = Geometric Average, AL = Action Level – applies to tables 6 and 7.
7	Summary data for postcode sectors in England and Wales	
8	Summary data for strategic health authorities in England	
9a	Summary data for NHS primary care trusts in England	
9b	Summary data for NHS local health boards in Wales	
10a	Estimated number of residential addresses at or above the Action Level by borough, district or city council in England	Derived from the current England and Wales dataset (Miles et al 2007) – applies to table 10a – 12b. This information is not available by direct calculation from indicative radon probability maps
10b	As table 10a but by unitary authority in England	
10c	As table 10a but by unitary authority in Wales	
11	As table 10a but by post town in England and Wales	
12a	As table 10a but by NHS primary care trust in England	
12b	As table 10a but by NHS local health board in Wales	

General notes

- In all tables the estimates of the number of addresses are derived from the Royal Mail Postal Address Files (PAF®). PAF also provides administrative and health authority information for each delivery point in England and Wales (along with Scotland and Northern Ireland) and is maintained by Royal Mail® as their primary source of postal address data for the United Kingdom. It should be noted that the estimates of the housing stock in each table may differ from other sources primarily due to the removal of non-residential addresses from the dataset. Addresses classed as non-residential by Royal Mail® are predominantly workplaces and PO boxes.
- To avoid undue precision all numbers other than averages have been rounded to two or three significant figures.
- Administrative and health group codes are those promulgated by the Office of National Statistics as at April 2009.

Notes on Royal Mail postcode

- Royal Mail® postcodes have four parts read from left to right, representing progressively smaller groups of addresses.
- Postcodes have two elements (of two parts each) separated by a space.
- The largest part (both in terms of geographical area and addresses) is the postcode area.
- The postcode area is given by the first one or two alphabetical letters of the postcode and refers to the post town (for example, OX for Oxford). A small number of postcode areas have a single letter representing the post town (for example, B for Birmingham).
- There are just over 100 postcode areas in England and Wales.
- Postcode areas are not aligned to national or other administrative boundaries. Several postcode areas cross the England and Wales border (such as CH and SY) and two cross the England and Scotland border (DG and TD).
- Postcode districts consist of the postcode area and the numbers that together make up the first element of the full postcode. The postcode district of OX11 0RQ would be OX11.
- Postcode sectors consist of the postcode district together with the numerical part of the second element. The postcode sector of OX11 0RQ would be OX11 0.

4 CONCLUSIONS

This report presents summary results of the distribution of measured and estimated radon levels in homes in England and Wales, grouped by various geographical areas. The information is based on surveys carried out over many years. It complements the full radon probability dataset, described elsewhere (Miles et al, 2007). Overall the total number of homes in England and Wales above the radon Action Level is estimated to lie in the range 100,000 to 200,000.

While the results in this report give a good indication of the distribution of measured and estimated radon levels in different areas, the probability that the Action Level will be exceeded at a specific address is best assessed using the full radon probability dataset, accessible through www.ukradon.org. The actual level of radon at any specific address can only be determined through an appropriate radon measurement.

5 ACKNOWLEDGEMENTS

We wish to thank present and past members of the radon team at HPA and previously NRPB for all their efforts.

The data reported were collected during many surveys carried out on behalf of the English and Welsh Governments, local councils, landlords and individual householders.

7 GLOSSARY

Averages. Within this report numerical data are presented in two ways: arithmetic average and geometric average. The arithmetic average is derived from summing the results by grouped unit then dividing by the number of results. The geometric average is the n^{th} root of the product of n results.

Becquerel. Symbol Bq. The SI unit of radioactivity and measures the activity of a radionuclide transformations or decay. An activity of 1 becquerel denotes an activity of 1 nuclear transformation or decay per second.

Becquerel per cubic metre of air. Symbol Bq m^{-3} . A quantity indicating the amount of radionuclide transformation in each cubic metre of air per second. Often referred to as the activity concentration.

Population-weighted average. The value obtained for the analysis of a sample selected in which each member of the population has an equal chance of inclusion in the sample. In the specific case of the UK National Radon Survey (NRPB 1988), the population was every domestic address in the UK and a systematic sample was taken, i.e. every N^{th} address, from all domestic addresses listed in postcode order.

Radon Action Level. The activity concentration of radon in UK homes above which reduction is advised. Its value, expressed as the annual average radon gas concentration in the home, is 200 Bq m^{-3} .

Radon Affected Areas. Parts of the country with a 1% or greater probability of present or future homes being at or above the Action Level.
