

Countryside Stewardship priorities for the Hampshire Downs

Choosing priorities

Countryside Stewardship is a competitive scheme and funding is limited. Not all eligible applicants will be offered a grant. This guide will help applicants choose the options that will increase their chance of success.

Countryside Stewardship applications are scored - both top priorities and other priorities (listed in the boxes below) score points. Applicants should select at least one top priority. Choosing other priorities will improve an application's score.

Top priorities

Priority group	Priority type
Biodiversity	Priority habitats
	Priority species
Water	Water quality
	Flood and coastal risk management
Historic environment	Designated historic and archaeological features
	Undesignated historic and archaeological features of high significance
Woodland	Woodland management
	Woodland planting
Landscape	
Multiple environmental benefits	

Other priorities

Priority group	Priority type
Other priorities	Archaeological and historic features
	Woodland
	Climate change

Biodiversity - top priorities

Priority habitats

Applicants should choose land management options and capital works that maintain, restore and create priority habitats and support priority species that depend on these habitats.

Priority habitats to be maintained include:

- lowland meadows including water meadows
- lowland fens
- coastal and floodplain grazing marsh
- wood pasture and parkland with veteran trees
- ancient and native woodland
- lowland calcareous grassland
- riparian habitats associated with priority rivers and lakes
- arable field margins

Priority habitats (especially projects to enlarge existing sites or help join up habitat networks) to be restored include:

- lowland meadows including water meadows
- lowland fens
- coastal and floodplain grazing marsh
- wood pasture and parkland with veteran trees
- ancient and native woodland
- lowland calcareous grassland
- riparian habitats associated with priority rivers and lakes

Priority habitat creation to extend or link priority habitat to increase connectivity and reduce fragmentation. In particular, create priority habitat that will also contribute significantly to improvements in:

- water quality
- air quality
- flood and coastal risk management

Sites of Special Scientific Interest (SSSI)

Restore or maintain SSSIs that include features eligible for options – this includes options that will reduce diffuse water and air pollution effects.

Priority species

Managing priority habitats will create the habitat needs for many of the priority species associated with this area. In particular by providing such essential elements as bare ground, areas of scrub and varied sward structures which will help these species thrive.

This area also has a number of priority species that need tailored management and advice. Applicants should choose land management options and capital works that meet the specific needs of the following priority species:

- corn bunting
- lapwing
- stone curlew
- turtle dove
- willow tit
- pearl-bordered fritillary
- Duke of Burgundy
- brown hairstreak
- striped lychnis
- six-spotted pot beetle
- carline thistle leafhopper
- *Anaptychia ciliaris* subsp. *ciliaris* (a lichen)
- *Caloplaca virescens* (a lichen)
- lesser horseshoe bat
- deptford pink
- juniper

Woodland bird assemblage

Parts of this area are targeted for their variety of woodland birds. Natural England has assessed the area as being nationally significant where 4 or more of the following species occur:

- lesser spotted woodpecker
- tree pipit
- redstart
- pied flycatcher
- spotted flycatcher
- wood warbler
- marsh tit
- lesser redpoll
- hawfinch

In these areas applicants should choose land management options and capital works that maintain or enhance conditions for woodland birds.

Arable plant assemblage

This area has cultivated land that may contains nationally threatened and declining populations of arable plants. The correct management of these areas will help these species thrive and help their populations increase.

The Wild Pollinator and Farm Wildlife Package

This package is a collection of scheme options that benefit wild pollinators, farmland birds (such as grey partridge, tree sparrow and yellowhammer) and other farm wildlife (such as arable plants, great crested newt, bats and brown hare).

The package is voluntary, but an application will have a greater chance of success if options from the package are chosen.

The options provide the essential resources (especially year-round food, shelter and nesting places) that wild pollinators, birds and farm wildlife need to survive and reproduce. These include:

- sowing nectar flower mixes

- increasing flowers on grassland
- sowing winter bird food mixes
- managing hedgerows and other key farm habitats (like ponds and ditches)

Mid-Tier

Applicants can choose from groups of options for different farm-types – arable, mixed or pastoral. Typically, the options should be applied over a minimum of 3% to 5% of the farmed land on the holding.

Higher Tier

An application will have a greater chance of success if the holding has already helped wildlife thrive under previous schemes. For example, where a Higher Level Stewardship agreement is coming to an end, and from other areas where priority farmland species are present.

Applicants can choose from similar groups of options, tailored to their holding, in consultation with a Natural England adviser. Typically, the options will cover a minimum of 5% to 10% of farmed land to target a broader range of farmland species and habitats

Applying the right combination of these options over at least 3% of the farmed land on a holding will bring benefits to farm wildlife.

Water - top priorities

Water quality

Applicants should consider options and capital works in the water quality options table that address:

- phosphate, nitrate, sediment and pesticides in the Wey, Upper and Middle Test, Lower Test and Southampton Streams, Loddon and Kennet catchments
- phosphate, nitrate and sediment in the Hampshire Avon, East Hampshire and Itchen catchments
- sediment and pesticides in the Western Rother catchment

This includes:

- groundwater drinking water sources near Andover, Chilbolton, Hungerford, Otterbourne, Overton, Michelmersh, Twyford and Upper Wooton affected by nitrates
- groundwater drinking water sources near Aldershot affected by pesticides
- surface water drinking water sources affected by pesticides on the Lower Test, the Thames between Cookham and Egham, the Western Rother and part of the River Wey
- catchments of the River Avon and Avon Valley affected by phosphate, nitrate and sediment
- catchments of the River Itchen and the Solent affected by phosphates and nitrates
- River Kennet affected by phosphate and sediment
- River Test, River Itchen and Alresford Pond SSSIs affected by phosphate and sediment

These options help improve water quality by controlling the source or the movement of potential pollutants, including:

- nutrients from fertilisers, manures and organic materials
- sediment from soil erosion and run-off
- pesticides from their use and disposal

Flood and Coastal Risk Management

An application will have a greater chance of success if applicants select options for flood and coastal risk issues in the priority areas of the:

- upper reaches of the River Itchen catchment above Winchester
- upper reaches of the River Test catchment above Romsey
- top of the River Wey Catchment

Applicants should choose options from the flood risk table that:

- reduce the amount and rate of surface water run-off
- reduce soil erosion
- slow the movement of floodwaters on floodplains

Historic environment - top priorities

Historic environment

Applicants should choose active management which ensures the long-term survival of historic environment features and protects them against damage and decay. In particular some of the biggest land management threats in this area are from:

- arable cultivation
- forestry
- scrub and tree growth

The following features are a high priority for active management in this area:

- designated features - archaeological features of national significance (Scheduled Monuments), Registered Parks and Gardens (RPG) and Registered Battlefields (RB)
- designated and undesignated traditional farm buildings and non-domestic historic buildings on holdings
- undesignated historic and archaeological features of high significance which are part of the Selected Heritage Inventory for Natural England (SHINE)

Applicants should consider options and capital works to:

- revert archaeological sites under cultivation to permanent grass
- reduce damaging cultivation and harvesting practices through minimum tillage or direct drilling where this provides a suitable level of protection
- remove scrub and bracken from archaeological or historic features
- maintain below-ground archaeology under permanent uncultivated vegetation or actively manage earthworks, standing stones and structures as visible 'above ground' features
- maintain and restore historic water management systems, including those associated with water meadows and designed water bodies
- restore historic buildings that are assessed as a priority in the area
- maintain or restore Registered Parks and Gardens, including structures or features that contribute to the design intentions or feel of the parkland or provide for their biodiversity and amenity value
- protect or enhance the condition of Registered Battlefields

Woodland - top priorities

Woodland management

Climate change, pests (such as deer and grey squirrels) and various diseases threaten woodland. Applicants' proposals will need to address such threats where present.

Certain types of woodland are a high priority for bringing into management, including:

- protected woodland – those designated for their national biodiversity value
- priority woodland habitat – other unmanaged broadleaved woodland
- priority species – target woodland within priority areas for woodland priority species
- planted ancient woodland site (PAWS) restoration – conversion of conifer plantations on ancient woodland sites to broadleaf woodland within priority woodland habitat networks
- United Kingdom Forestry Standard – unmanaged conifer woodland within catchments subject to eutrophication and acidification, both to reduce pressures on the water environment and improve biodiversity

All management should comply with the United Kingdom Forestry Standard and other relevant guidance such as ['Managing ancient and native woodland in England'](#).

Woodland planting

High priority objectives for new woodland planting include:

- biodiversity – planting to buffer and link existing woodlands and other semi-natural open habitats within priority woodland habitat networks
- water quality – planting designed to reduce and intercept diffuse pollution from agriculture
- flood risk – planting designed to increase infiltration of heavy rain into the ground, reduce erosion, or slow the flow of floodwaters on floodplains

Landscape

Each application is likely to include a range of landscape features whose restoration should form an important part of agreements. Top priority in the area is the maintenance and restoration of features that will enhance the pattern and scale of the landscape and add to the area's 'sense of place'.

Top priorities in this area for landscape are:

- hedgerows

- in-field trees
- bankside trees
- permanent grassland
- field margins and buffers

Multiple environmental benefits

Applicants should look to provide for multiple priorities by selecting options that achieve multiple environmental benefits.

In this area, the greatest opportunity to achieve multiple objectives is by:

- reconnecting the rivers Test and Itchen with their floodplains by choosing a combination of grassland options and bankside management, in locations where this will reduce nutrient and sediment runoff, improve water quality, enhance landscape features such as historic water meadows and reduce the levels of flood risk to towns such as Romsey and Winchester
- adopting a range of in-field arable options such as pollen and nectar plots, beetle banks and cultivated fallow plots within the downland area where these measures will help to protect historical features and benefit farmland birds, rare arable plants, pollinating insects, water quality, landscape character, groundwater resources, flood risk and biodiversity
- restoring historic hedgerows to strengthen the local landscape character and provide wildlife corridors, especially in sheltered valleys and the east side of the NCA, in locations where hedgerows will intercept surface run-off to decrease soil erosion and benefit water quality and flood risk management
- selecting options to protect soil and water such as buffer strips, riparian management strips and management of intensive grassland adjacent to water courses in the Test and Itchen catchments, in locations where this will improve both water quality and biodiversity in addition to supporting flood risk management
- enhancing and expanding chalk grassland and scrub habitats in the downland area where this will benefit pollinating insects, reduce surface run-off rates into watercourses, strengthen landscape character and help improve water quality and flood risk management
- enhancing existing woodlands and expanding woodland cover in locations where well managed woodland can benefit landscape character, biodiversity, water quality and flood risk, in addition to wider climate change, economic and social benefits - key locations include:
 - the River Test catchment

Other priorities

Applicants should select at least 1 of the top priorities. However, applicants can also select other priorities, as this will increase the score of the application.

Historic environment

The following historic environment features are lower priorities:

- designated and undesignated traditional farm buildings
- undesignated SHINE features of medium and low Significance
- priority undesignated historic parklands

Woodland Management

Woodlands not included in the top priority categories listed above are a lower priority for management but may still be supported.

Woodland Planting

Areas are prioritised for new planting based on their potential to create biodiversity and water benefits.

Woodland planting schemes are scored depending on where the proposed scheme is in relation to the opportunity maps for woodland planting in England and how well the planting design will benefit biodiversity and water.

Other priorities for appropriately designed biodiversity schemes exist across the whole of England. Opportunities for new woodland planting for water only exist in certain parts of England.

Climate change

By choosing land management options and capital works which support the management of the vulnerable features and habitats listed in this statement, including where vulnerabilities are increased by climate change, applicants will support the resilience of biodiversity, water and other scheme priorities to the impacts of climate change, which is a cross-cutting objective of the scheme.
