

BS EN 62676-2-2 – Video surveillance systems for use in security applications, Part 2-2: Video transmission protocols–IP interoperability implementation based on HTTP and REST services.

This standard specifies a compliant IP video protocol based on Hypertext Transfer Protocol (HTTP) and Representational State Transfer (RST). This is how devices send data and information to each other.

Video transmission devices are often fitted with web servers that respond to HTTP requests for information. The standard sets out how video devices respond to requests for information in a uniform way and connect together over the internet.
