

Re UK Government Consultation  
on Future of UK Plutonium.

Long term storage would be the option I would investigate. What I would suggest is storing the Plutonium in rail mounted flasks for ease of inspection.

These waggons could then be located from a rail link, possibly the Glasgow to Fort William or Perth to Inverness lines. Within an underground storage facility, say in a granite mountain common (I think) on those lines.

What may complicate this is the possibility of heat being given off by the Plutonium. But a reliable air conditioning,

system should cope with it.

Obviously there would have to be a predominance of long lasting construction materials like stainless steel etc.

This is my general idea for your consideration. I will be most interested to hear the final verdict.

Yours Sincerely
