A. INTRODUCTION

1. The UK has decided to opt-in nitrous oxide (N₂O) emissions from nitric acid production in the European Union Emissions Trading System (EU ETS) for the period from 1st April 2011 to 31st December 2012¹. Article 24 of directive 2003/87/EC of the European Parliament and of the Council establishing a scheme for greenhouse gas emission trading within the Community (the ‘EU ETS directive’) provides that Member States from 2008 can make an application to the European Commission to include unilaterally additional activities and gases into EU ETS. The UK applied to the European Commission to unilaterally opt-in N₂O emissions from nitric acid production into Phase II of the EU ETS. This application was approved by the European Commission on [date to be inserted]. This appendix sets out the total quantity of allowances distributed to installations as a result of the N₂O opt-in; the sources of these allowances; rules for any new entrants in the nitric acid producing sector; and general conditions on nitric acid producing installations.

2. There is an extremely high N₂O emissions reduction potential in the nitric acid production sector which means that operators can bring their emissions down significantly once a carbon price signal is brought to bear on their emissions. In addition, N₂O is a highly potent greenhouse gas with a global warming potential of 310 times that of Carbon Dioxide (CO₂). For the UK’s two nitric acid producing installations, the average per annum emissions of N₂O from nitric acid production from 2002-2008 were 3,492 tonnes of N₂O, or 1,082,545 tonnes of CO₂ equivalent.

¹ Carbon Dioxide (CO₂) emissions from nitric acid production are not covered by the opt in.
(tCO$_2$e). In addition, the average emissions intensity over these installations for the same period was 3.0 kg N$_2$O/ tonne of 100% nitric acid. It is anticipated that an opt in will reduce the UK’s annual emissions of N$_2$O to approximately 160,000 t CO$_2$e and the average emissions intensity to 0.42 kg N$_2$O /tonne of 100% nitric acid by the end of Phase II. Therefore, the opt-in will assist the UK in reducing emissions under the Kyoto Protocol 1$^{st}$ commitment period, and meeting our national carbon budgets. It will also help our transition to a low carbon economy.
B. DETERMINATION OF ALLOCATION OF ALLOWANCES FOR N₂O EMISSIONS FROM NITRIC ACID PRODUCTION

B.1 Allocation Methodology

3. UK installations included in the EU ETS as a result of the unilateral N₂O opt-in will be allocated free allowances according to a benchmark as set out in the below formula:

\[
\text{Annual incumbent installation allocation} = \left( \frac{\text{Benchmark level (kg N}_2\text{O/tonne of 100% nitric acid)}}{1000} \times \text{Relevant production (tonnes of 100% nitric acid)} \right) / 310
\]

4. The N₂O opt-in benchmark level will be as follows: 1.5 kg N₂O / tonne of 100% nitric acid in 2011, and 1.3 kg N₂O / tonne of 100% nitric acid in 2012. To calculate the level of allocations installations will be required to submit independently verified production data in tonnes of 100% nitric acid produced for the baseline period 2002 to 2008 inclusive. For the allocation methodology “relevant production” is an average of production from the years 2003, 2005 and 2008. These are the highest overall production years for the opted in installations.

5. The UK N₂O opt-in is effective from either 1st April 2011 or the date upon which the European Commission approves the activities, whichever is the later. Consequently, the annual installation level allocation for 2011 will be pro-rated to reflect the opt-in start date. Allowances are normally issued to EU ETS installations by 28th February each year. Allowances for opted-in activities for 2011 will be issued after the 1st May 2011, and by 28th February 2012 for 2012. The registry administrator must, in relation to the opted-in activities, withhold the issue of allowances for 2011 until after 1st May 2011.

B2 Installation level allocation

6. In the UK, there are two installations which produce nitric acid, both are operated by GrowHow UK Ltd. These installations are at Ince and Billingham.
7. Based on the allocation formula and benchmark levels set out in section B1, for the period of 2011 – 2012 inclusive a total of 922,353 EU allowances will be allocated to the nitric acid sector for N₂O emissions based on the opt-in date of 1st April 2011. These allowances will be allocated in the following manner:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Installation name</th>
<th>2011</th>
<th>2012</th>
<th>Total</th>

</tbody>
</table>

8. The two incumbent nitric acid producing installations effected by the UK opt-in are already included in Phase II EU ETS under the combustion activity with a rated thermal input exceeding 20 MW listed in Annex I of the EU ETS Directive. Therefore the opt in of N₂O emissions for nitric acid production will represent an amendment to these installations’ Phase II National Allocation Plan allocations. Table 2 below sets out these changes.

*Incumbent* refers to installations which are in operation on 30th June 2010 (i.e. the date of the UK Article 24 opt in application to the European Commission).

9. Allowances for incumbent nitric acid producing installations will be obtained from the allowances that have returned to the UK Government from the main EU ETS due to the closure of installations in the UK. These allowances would have otherwise been auctioned by the UK Government under section H, appendix D. No new allowances will be created to facilitate the opt-in. This is in order to further improve the environmental integrity of the EU ETS and to ensure that the UK’s cap remains tight for the remainder of Phase II.

10. The Government still intends to auction or sell any additional surplus allowances from closures beyond the level required for the opt in, up to the 10% (of the UK cap) auctioning limit set out the EU ETS directive.

C. ACCESS TO PROJECT CREDITS

11. An operator of an installation may not use certified emission reduction units (CERs) issued pursuant to Article 12 of the Kyoto Protocol or emission reduction units (ERUs) issued pursuant to Article 6 of the Kyoto Protocol in order to comply with an obligation to surrender allowances relating to emissions of N₂O.

D. NEW ENTRANTS

12. Installations that commence the activity of nitric acid production after 30th June 2010 and before the 31st December 2012 (‘new entrants’) and have obtained a new permit or variation to their permit to include this activity, will be entitled to apply for an allocation of free allowances. This does not include extensions to existing installations carrying out nitric acid production.

13. Where the provisions of paragraph 12 above apply to an operator, to the extent those provisions are contrary to the provisions of Section D (paragraphs 26 to 28) and Section F (paragraphs 29 to 57, and paragraphs 61 to 70) of Appendix D, paragraph 12 of this Appendix shall take precedence.

14. New Entrants will be allocated using a benchmark of 0.12kg N₂O /tonne of 100% nitric acid. This is consistent with the most challenging end of the European Commission’s Integrated Pollution Prevention Control Reference Document on the Best Available Technologies for the manufacture of large volume inorganic chemicals, including nitric acid production. This benchmark level will be applied to a “relevant production” proxy. This proxy will be calculated by the verified installed capacity of the new installation multiplied by standard factors for the number of operational days (330) and load (90%). The formula for allocating to nitric acid producing new entrants is set out below:
15. In line with other EU ETS new entrants, the Government will take a standardised approach to commissioning that assumes a commissioning period of 50 days, during which new entrants will receive only 50% of their allocation rather than receiving an allocation based on the full, commercial rate of operation from the start date of the installation.

16. New entrants in the nitric acid sector will be required to apply for allowances from the main New Entrants’ Reserve (NER). They will also follow the same allocation process as other EU ETS new entrant. Details of the NER allocation process are set out in section G, appendix D (paras 88 – 128). New entrants in the nitric acid sector will not be required to comply with paragraph 105b of section G and paragraph 4 of section A in appendix D. Such new entrants will not be able to use the new entrant spreadsheet to calculate indicative allocations. Instead, they should use the new entrant formula set out in this appendix F.

E. CLOSURES

E1 Complete & Temporary closures
17. Complete and temporary closures in the nitric acid producing sector will be dealt with in the same way as other EU ETS installations as set out in section F, appendix D (para 71-78).

E2 Partial closure
18. An installation in the nitric acid producing sector which is deemed to have partially ceased to carry out nitric acid production, or in other words significantly reduced its level of production, will retain its full allocation relating to nitric acid production for the year in which the reduction happened but will receive a revised allocation for

---

### Annual allocation methodology for nitric acid producing sector ‘new entrants’:

\[
\text{Annual new entrant installation allocation} = \left( \frac{\text{New entrant benchmark level (0.12kg N}_2\text{O/tonne of 100% nitric acid)}}{\text{Relevant production proxy (tonnes of 100% nitric acid per year)}} \times 310 \right) / 1000
\]

Where:

\[
\text{Relevant production proxy (tonnes of 100% nitric acid per year)} = \frac{\text{Installed capacity (tonnes of 100% nitric acid per day)}}{330 \text{ days}} \times 90\%
\]
subsequent years. In effect only nitric acid producing installations partially ceasing operation in 2011 will receive a reduced allocation in Phase II.

19. Table 3 sets out the schedule of amendments to the annual allocation level of a nitric acid producing installation as a result of it partially ceasing nitric acid producing activities compared to the “relevant production” (i.e. the level of production used in the initial installation-level allocation methodology). An operator of a nitric acid producing installation must notify the regulator in writing before 30th January 2012 if they go above any of the thresholds set out in table 3. The regulator will calculate the installation’s 2012 allocation as per table 3, and notify the operator and the Government of the change. The Government will notify the European Commission of the change and a revised allocation for 2012 will subsequently be issued to the operator.

20. The registry administrator is obliged to issue allowances to installations by 28th February each year. At the time it does so, it may not be clear if any nitric acid producing installations have partially ceased to operate in the period from 1st April 2011 to 31st December 2011. In order to address this, the registry administrator may delay the issue of allowances to a particular installation until it is clear that it did not partially cease to operate in the previous year.

21. The Government intends to auction or sell any surplus allowances from installations from the nitric acid producing sector which have closed or partially ceased operations.
F. RATIONALISATIONS

22. Rationalisation occurs when Annex I activities at one EU ETS installation are closed and moved to another EU ETS installation(s) owned by the same operator. Nitric acid producers that rationalise their production are not entitled to retain the free allocation relating to the activities that have ceased operating.

23. Where the provisions of paragraph 22 above apply to an operator, to the extent those provisions are contrary to the provisions of Section F1 (paragraphs 79 to 87) of Appendix D, paragraph 22 of this Appendix shall take precedence.
