Monthly Legionella Report
September 2015
National Surveillance Scheme for Legionnaires’ disease in Residents of England and Wales
About Public Health England

Public Health England exists to protect and improve the nation’s health and wellbeing, and reduce health inequalities. It does this through world-class science, knowledge and intelligence, advocacy, partnerships and the delivery of specialist public health services. PHE is an operationally autonomous executive agency of the Department of Health.
Introduction

The national surveillance scheme for Legionnaires' disease in residents of England and Wales is co-ordinated by PHE.

The main objectives of the scheme are to:

- detect clusters and outbreaks of Legionella in England and Wales or abroad through the surveillance of all reported cases
- identify sources of infection so that control measures can be assessed and where necessary improved upon, to prevent further cases
- as a member state, collaborate with the European Legionnaires' disease Surveillance Network (ELDSNet) in the detection, control and prevention of cases, clusters and outbreaks within European countries through the reporting of travel associated cases of Legionnaires' disease

This report provides a summary of data extracted from the national Legionella database for confirmed and suspected cases of Legionellosis in residents of England and Wales, as reported to the national surveillance scheme during the month of September 2015.

The report does not provide an accurate representation of Legionella activity in England and Wales during this time period due to delays in reporting. This means that the data for this month may not be comparable with data for the same period in previous years. Changes as updates reported after the date of this report will be updated in subsequent monthly reports as further data becomes available.

Figures are correct at the time of publication and may be subject to change.
Legionella data: September 2015

All data presented in this report is correct as at 03 September 2015.

**Table 1: Cases reported/notified†**

| Number of reported/notified† cases‡ of Legionnaires' disease during September 2015 | 77 |
| Number of reported/notified† cases of LD since 01 January 2015 | 357 |

† reported/notified cases are any cases reported to the national surveillance scheme via regional colleagues, laboratories and statutory notifications (including all confirmed and non-confirmed cases).
‡ cases reported with onset of symptoms between 01 January to 30 September 2015, inclusive.

**Figure 1:** Confirmed* cases of LD by category excluding unassigned cases with onset of symptoms in September 2015

* cases confirmed to have pneumonia and laboratory confirmation of Legionella infection; includes some with incomplete data.
Table 2: Number of confirmed* cases of LD by category with onset in September 2015

</table>

PCR: polymerase chain reaction
SBT: sequence based typing

Of the 265 cases of Legionnaires' disease reported to the National Surveillance Scheme 104 (39.2%) cases had a respiratory specimen taken and tested for Legionella infection. Of the 104 cases where a respiratory specimen was tested by culture and/or PCR, 88 (84.6%) specimens tested positive for Legionella pneumophila serogroup 1 and a complete or partial sequence type has been determined for 74 (84.1%) of culture and/or PCR positive cases.
(Please note that some results may still be pending at the time of this report.)
