This report covers attitudes towards the following topics:

- Current travel behaviours and willingness to change
- Attitudes on road safety
- Transport and the environment
- Congestion, road building and exhaust fumes

**About these statistics**

This statistical release is part of a series of surveys measuring people’s attitudes towards transport since 1996.

The British Social Attitudes Survey is conducted by NatCen Social Research and contains questions on attitudes towards transport sponsored by the Department for Transport. It is a representative survey of adults aged 18 and over in Great Britain, collecting data through a combination of face-to-face interviews and self-completion questionnaires.
Main results

Section 1: Current travel behaviours and willingness to change
- Current travel behaviours: how do people travel?
- Access to bike and perception of cycling
- Willingness to switch to more sustainable modes of transport

Section 2: Attitudes to transport and the environment
- Transport and climate change
- Willingness to change travel behaviour for the environment
- Opinions on the environment and plane travel
- Opinions on the environment and car travel

Section 3: Attitudes to congestion, road building and exhaust fumes
- Opinions on congestion
- Opinions on road building
- Opinions on exhaust fumes

Section 4: Attitudes to road safety
- Attitudes on road safety and drink driving
- Attitudes on road safety and mobile phone use
- Attitudes on road safety and speed cameras
- Opinions on residential streets

Background information
Main results

Behaviours and willingness to change

For journeys of less than two miles travelled by car, 41% of respondents said they could just as easily cycle, walk (39%), and take the bus (32%).

Men were more likely to say that they could switch to cycling for short journeys made by car as did respondents with access to a bicycle.

In 2014, 64% of respondents agreed that it is too dangerous for them to cycle on the road, the highest level recorded since the question was introduced in 2011.

Women, non-cyclists and older age groups showed higher levels of concerns over roads being too dangerous to cycle on.

Transport and the environment

In 2014, 79% of respondents believed that climate change is taking place and is, at least, partly a result of human actions. This figure is the highest since it was asked in 2011.

Respondents who travelled by plane at least three times in the last 12 months were more likely to agree that people should be able to travel by plane as much as they like, even if this harms the environment and even if new terminals or runways are needed to meet the demand.

Nearly two thirds of respondents agreed that people who drive cars that are better for the environment should pay less to use the roads.

Congestion, road building and fumes

In 2014, concerns about congestion on motorways have risen since its low point in 2011. Around 3 in 10 respondents considered congestion on motorways to be a serious problem.

Men were more likely than women to consider motorway congestion to be a problem (35% compared to 25% of women).

Drivers were more likely to agree that traffic in towns and cities is a problem (48%) than non-drivers (40%).

In 2014, concerns about exhaust fumes in towns have increased since 2009, with half of respondents considering exhaust fumes in towns and cities to be a serious problem.

Road safety

In 2014, 85% of respondents agreed that if someone has drunk any alcohol they should not drive. Women and non-drivers were more likely to agree.

57% of respondents agreed that all use of mobiles while driving is dangerous, and 45% agree that it should be banned. Women and older age groups were more likely to agree.

A vast majority (88%) agree that people should drive within the speed limit.

About half of respondents think that speed cameras are mostly there to make money and 36% said that there are too many of them, but agreement with these statements has decreased in the last decade.
Current travel behaviours: how do people travel?

Understanding travel behaviours is an important first step in exploring attitudes to travel and people’s willingness to switch from one mode to another.

Car was by far the most commonly and regularly used mode of transport in 2014. Indeed, 66% of respondents reported travelling by car as a driver at least once a week, and 59% reported travelling by car as a passenger at least once a week. Car driving appears to be a particularly frequent mode for daily use, with 41% of respondents saying they travel by car as a driver every day or nearly every day (Chart 1).

Other modes of transport were used less frequently. Only 27% of respondents said that they travelled by local bus at least once a week, and 9% by train at least once a week. Moreover, 14% of respondents said that they travelled by bicycle at least once a week, but 66% reported that they never travel by bike, which is the highest percentage of non-use compared to other modes shown here (Chart 1).

Other sources

Frequency of travel by mode presented here is consistent with figures from the National Travel Survey (NTS0313). Detailed information on how people travel are available at: https://www.gov.uk/government/collections/national-travel-survey-statistics.
Air travel was a less frequently used mode. In 2014, 51% of respondents said that they made no trip by plane in the last 12 months, and 32% said that they travelled by plane once or twice in the last 12 months. Only 7% of respondents reported travelling by plane at least 5 times in the last 12 months (Chart 2).

In 2014, 18% of respondents said that their household did not own or have regular use of any car or van, 41% said that their household had one car or van, and 40% said that there were two or more cars or vans in their household (Chart 3). These proportions have remained stable since the question was introduced in 2006.
Access to bike and perception of cycling

In 2014, 43% of respondents had access to a bike, either because they owned or had the regular use of a bicycle (Chart 4). Moreover, 39% of respondents said that they had ridden a bicycle in the last 12 months. For the analysis, a cyclist is defined as someone who both has access to a bicycle and has ridden one in the last 12 months. Using this definition, 31% of respondents were cyclists in 2014.

Chart 4: Access to a bicycle [ATT0310 - ATT0311]

- Own a bicycle: 40%
- Regular use: 3%
- No regular use: 57%

Being a cyclist was not evenly spread in the population in 2014 (Chart 5). Men are significantly more likely than women to be cyclists (40% compared to 24%). The proportion of cyclists also significantly decreases for older age groups (55+) and increases with household income. Adults in households with at least one child are also significantly more likely to be cyclists (Chart 6).

Chart 5: The proportion of cyclists varies...

- By gender: 40% male, 24% female
- By age:
  - 18-24: 36%
  - 25-34: 39%
  - 35-44: 40%
  - 45-54: 39%
  - 55-64: 28%
  - 65+: 13%

Definition

In this report, a **cyclist** is defined as someone who has access to a bicycle and has ridden a bicycle in the last 12 months.

Other sources

Detailed figures on bicycle access by age can also be found in the National Travel Survey (NTS0608). Further statistics on frequency of cycling can be found in DfT’s Walking and cycling statistics: [https://www.gov.uk/government/collections/walking-and-cycling-statistics](https://www.gov.uk/government/collections/walking-and-cycling-statistics)
In 2014, 64% of all respondents said that they agree or strongly agree with the statement ‘it is too dangerous for me to cycle on the road’, whereas 19% disagreed or strongly disagreed (Chart 8).

This is a significant increase from last year (61% in 2013), and the highest level of concern recorded since the question was introduced in 2011 (chart 7).
Concern about the safety of cycling on the road is not evenly spread in the population either (Chart 9). Women are significantly more likely to think that it is dangerous for them to cycle on the road than men (71%, compared to 57%). The proportion of people who think that it is too dangerous for them to cycle on the road also increases with age.

Actual travel behaviours are also likely to play a role in influencing attitudes towards the safety of cycling. Indeed, cyclists are significantly less likely to be concerned about the road being dangerous to cycle on than non-cyclists (51% compared to 70%) and drivers show lower levels of concern than non-drivers (63% compared to 66%, although the difference is not significant). Attitudes are also likely to determine behaviours: being confident about cycling on the road could lead to cycling effectively.

... by whether they cycle

| Cycle? | 51% | 70% |

... by whether they drive

| Drive? | 63% | 66% |
Finally, the effects of being a cyclist and gender interact with the attitudes towards the safety of cycling (Chart 10). Indeed, non-cyclist females are significantly the most likely to think that it is too dangerous for them to cycle on the roads (74%), whereas male cyclists are the least likely to think so (45%). Levels of concern are not significantly different between female cyclists and male non-cyclists.

**Chart 10: Confidence cycling on the road by gender and cycling behaviour**

Proportion of respondents who agree / strongly agree that ‘it is too dangerous for me to cycle on the road’

- Cyclists:
  - Male: 45%
  - Female: 61%

- Non-cyclists:
  - Male: 65%
  - Female: 74%

**Willingness to switch to more sustainable modes of transport**

Short journeys made by car are important to consider when investigating people’s willingness to switch to more sustainable transport modes - particularly to local buses, walking and cycling. On average, respondents reported making 5 journeys of less than two miles by car in a typical week (unchanged from 2013). Short journeys made by car are frequent for respondents, with about a third (34%) saying that

**Chart 11: Number of journeys of less than two miles made by car in a typical week**

- None: 0%
- 1 to 3: 40%
- 4 to 6: 30%
- 7 to 9: 10%
- 10 and over: 10%
- Never travel by car: 0%
they make at least 4 journeys by car in a typical week. In 2014, 32% of respondents said that they
either do not drive or do not make any journey of less than two miles by car in a typical week (Chart
11).

A considerable proportion of respondents said that they could use alternative modes of travel for
short journeys made by car, be it by local bus, walking or cycling. Indeed, for many of the journeys
of less than two miles they now travel by car, 41% of respondents said they could just as easily
cycle, 39% said that they could just as easily walk, and 32% said that they could just as easily take the bus although a higher proportion of respondents (39%) disagreed (Chart 12). These results are
similar to the previous year.

In summary, two thirds of people make short journeys by car at least once in a typical week, and there is a considerable potential to switch to other modes of transport for these journeys.

Chart 12: Many of the journeys of less than 2 miles that I now make by car, I could
just as easily… [ATT0315 - ATT0317]

Willingness to switch to more sustainable transport modes varies however according to socio-
demographic characteristics (Chart 13). Indeed, men are significantly more likely to agree that they could switch to cycling for short journeys made by car than women (50% compared to 33%).
This may reflect lower levels of cycling amongst women and higher safety concerns (see previous section), or that more of the journeys undertaken by women are less practical with a bicycle than
with a car. Cyclists are also significantly more likely to agree that they could switch to cycling than non-cyclists for short journeys made by car (58% compared to 33%).
Chart 13: The proportion of respondents who agreed or strongly agreed that for many of the journeys of less than 2 miles that they now make by car, they could just as easily walk, cycle or go by bus, varies...

...by gender

...by whether they cycle

...by age

...by household income

Willingness to switch from the car to other modes for short journeys seems to decrease with age. The 65+ age group is significantly more likely than all others to disagree that they could switch to walking and cycling, which is likely to be linked to the increase of mobility difficulties at older ages.

Willingness to switch to walking and cycling seems to increase with household income (although these differences are not significant) whereas the willingness to switch to local bus seems to decrease with income, which could be linked to both the affordability and the social acceptability of these modes. Indeed, all other incomes groups are significantly more likely to disagree that they could switch to the bus than the lowest income group (less than £1,200 per month).
Transport and climate change

In 2014, nearly 8 in 10 of respondents believed that climate change is taking place and is, at least, partly, a result of human actions. This figure is the highest since it was asked in 2011, although the difference is not significant (Chart 14).

In contrast, 14% of respondents believe that climate change is taking place but not as a result of human action and a lower proportion of respondents did not believe climate change is taking place (5%). These results were not significantly different from last years’ results.

Believing that climate change is a result of human actions seems to be lower in both the younger and older age groups with the middle age groups (35-54 year olds) more likely to believe that climate change is taking place and is, at least partly, a result of human actions. Conversely, the proportion of respondents who believed that climate change is taking place but not as a result of human actions was higher in the 65+ age group (18%) compared to the 35-44 year old age group (11%). There is also a significant difference by gender: a higher proportion of females believe that climate change is taking place than males.
Respondents were asked which transport modes they thought had the most impact on climate change and were allowed to choose up to three options. In 2014, the most commonly cited mode was vans/lorries, increasing from 68% in 2011 to 76% in 2014. The proportion of respondents who said cars increased significantly from 65% in 2013 to 69% in 2014. Whereas attitudes towards aeroplanes has decreased from 55% in 2011 to 53% in 2014, this was not significantly different from the previous year.

There were a few respondents (2%) who did not believe climate change was taking place or believe climate change will happen nonetheless.

In fact, the transport sector contributes around 26% of all greenhouse gas emissions (GHG) in the UK. The main source of emissions from transport is the use of petrol and diesel in road transport. In particular, cars accounted for 40% and aviation for 22% of GHG emissions (including international and domestic aviation). Heavy goods vehicles and light vans accounted for 15% and 10% of UK emissions respectively.

**Chart 16: Factors deemed to have the most impact on climate change [ATT0319]**

- Vans and lorries
- Cars
- Aeroplanes
- Buses and coaches
- Ships/ferries
- Motorbikes
- Trains

Note: respondents could choose up to three options so results do not add to 100%.

**Other sources**

Detailed figures on UK transport greenhouse gas emissions are available in the department for transport table ENV0201.

**Chart 17: UK transport GHG emissions by mode**

- Cars: 40%
- Aeroplanes: 22%
- Vans: 15%
- Lorries: 10%

Source: DECC UK greenhouse gas emission statistics, 2013. Note: Other transport modes also contribute to GHG emissions although very small, for example domestic and international shipping, rail, buses and coaches.
Willingness to change travel behaviour for the environment

Attitudes towards changing travel behaviour for the environment varied by transport mode. In 2014, 75% of respondents showed willingness to buy a car with lower CO₂ emissions, 37% said they are willing to reduce the amount they travel by car to help reduce the impact of climate change, and 21% said they are willing to reduce the amount they travel by plane to help reduce the impact of climate change (Chart 18). These results were not significantly different from last year.

Chart 18: Willingness to change travel behaviour for the environment [ATT0321 - ATT0323]

Chart 19: The proportion who agree or strongly agree varies...

When only looking at those who believed that climate change is taking place and is, at least partly, a result of human action, the percentage of respondents who agreed that they were willing to buy a car with lower CO₂ emissions was slightly higher (78%).
Similarly, 40% of those who believed that climate change is taking place and is, at least partly, a result of human action, agreed that they are willing to reduce the amount they travel by car to reduce the impact on climate change whilst 39% disagreed. This implies there are as many people in favour of reducing car use as are against.

Opinions on the environment and plane travel

As seen in Chart 2, more than half of respondents said they had not taken any trips by plane in the last twelve months, whilst nearly a third of respondents had taken one or two trips by air and 17% had travelled by air at least three times in the last 12 months.

The number of trips by plane have increased by household income (Chart 20). Respondents in the highest income group are more likely to travel at least three times a year compared to respondents in the lowest income group (36% and 6% respectively). In contrast, 74% of respondents in the lowest income group have not travelled by plane in the last 12 months compared to 25% of respondents in the highest income group.

Chart 20: Number of trips by plane in the last 12 months by household income

People feel strongly about the freedom to travel by plane. In 2014, 67% of respondents strongly agree or agree that people should be able to travel by plane as much as they like. However, when asked in the context of environmental impacts, the proportion who agree that people should be able to travel by plane as much as they like decreases (20%) (chart 21).
Almost half of the respondents agreed that people should be able to travel by plane even if new terminals or runways are needed and 41% agreed that the price of a plane ticket should reflect the environmental damage that flying causes. These results were not significantly different from the previous year.

Chart 21: Attitudes towards air travel and the environment [ATT0324 - ATT0327]

Men were more likely to agree that people should be able to travel by plane as much as they like, even if this requires new terminals and runways or harms the environment.

Chart 22: The proportion who agree or strongly agree varies by gender

‘People should be able to travel by plane as much as they like...’

‘... even if this harms the environment'  ‘... even if new terminals or runways are needed to meet the demand'

24%  17%  55%  40%
When looking at respondents’ plane use, those who travelled by air at least three times in the last 12 months were more likely to agree that people should be able to travel by plane as much as they like, even if this harms the environment and even if new terminals or runways are needed to meet the demand. Those that have not travelled by air in the last 12 months were more likely to disagree.

**Chart 23: Attitudes towards frequency of air travel and travel behaviours**

- **People should be able to travel by plane as much as they like**: 59% of those who have travelled by air at least three times in the last 12 months agree, compared to 71% of those who have not travelled by air in the last 12 months. Overall, 83% agree.
- **People should be able to travel by plane as much as they like, even if this harms the environment**: 20% of those who have travelled by air at least three times in the last 12 months agree, compared to 15% of those who have not travelled by air in the last 12 months. Overall, 36% agree.
- **People should be able to travel by plane as much as they like, even if new terminals or runways are needed to meet the demand**: 47% of those who have travelled by air at least three times in the last 12 months agree, compared to 40% of those who have not travelled by air in the last 12 months. Overall, 67% agree.
- **The price of a plane ticket should reflect the environmental damage that flying causes, even if this makes air travel much more expensive**: 39% of those who have travelled by air at least three times in the last 12 months agree, compared to 40% of those who have not travelled by air in the last 12 months. Overall, 44% agree.

**Opinions on the environment and car travel**

When respondents were asked whether people should be allowed to use their car as much as they like, even if it causes damage to the environment, respondents attitudes differed with 26% agreeing, 34% disagreeing and 36% remaining neutral. However, this differs to what respondents are prepared to do themselves (Chart 18): 75% agreed they were willing to buy a car with lower CO₂ emissions and around 37% said they are willing to reduce the amount they travel by car to help reduce the impact of climate change.
There was not much difference between attitudes to car and plane travel and damage to the environment, although people are more willing to give up flying than give up car use if it causes environmental damage (Chart 24).

**Chart 24: People should be allowed to use their cars as much as they like, even if it causes damage to the environment [ATT0329]**

![Chart 24: People should be allowed to use their cars as much as they like, even if it causes damage to the environment](chart24.png)

Nearly two thirds of respondents agreed that people who drive cars that are better for the environment should pay less to use the roads. In contrast, 62% of respondents disagreed that for the sake of the environment, car users should pay higher taxes.

There is a large gap between what people think should happen and what they report that they are prepared to do. Indeed, whilst only 37% of respondents indicated that they are willing to reduce the amount they travel by car to reduce the impact on climate change, 60% of respondents indicated that, for the sake of the environment, everyone should reduce how much they use their cars.

Attitudes towards environmental transport policies also differ between respondents. Around half (49%) of respondents agree that there is no point in reducing their car use to help the environment unless others do the same (Chart 25).
These results vary between drivers and non-drivers where drivers were seen to agree more with favourable statements.

Chart 25: Attitudes towards car travel and the environment

Chart 26: The proportion who agree or strongly agree varies between drivers and non-drivers
Opinions on congestion

In 2014, concern about congestion on motorways had risen since its low point in 2011. Around 3 in 10 respondents considered congestion on motorways to be a very serious or serious problem in 2014 compared to 22% in 2011.

Concern about traffic congestion in towns and cities had also risen from a low point in 2012, however was not significantly different from 2013 results. In 2014, 46% of respondents felt that traffic congestion in towns and cities was a very serious or serious problem.

Chart 27: Concerns about congestion as a very serious/serious problem, 2002 - 2014

Chart 28: Concerns about congestion, 2014
Concern about damage to the countryside from road building has consistently decreased since the question was first asked in 2005 when 76% of respondents seemed to be very/fairly concerned. In 2014, 62% of respondents indicated that they were concerned about damage to the countryside from road building, a slight increase from the previous year although not significant (Chart 29).

The proportion of those concerned was higher among those who drive but not significantly different compared to non drivers. Similarly, women were more likely to be very/fairly concerned about damage to the countryside from road building than men (66% compared to 57% of men).

The 25-34 year old age group were less likely to worry about damage to the countryside (57%); the 65 and older age group were more likely to worry about damage to the countryside compared to any other group (65%).

Men were more likely than women to consider motorway congestion to be a problem (35% compared to 25% of women) and more likely to consider congestion in towns and cities to be a problem (50% compared to 42% of women).
Respondents’ attitudes towards exhaust fumes in towns and cities have varied over time. Whilst responses were steady between 2004 and 2007, the lowest level of concern was seen after 2010. In 2014, half of respondents considered exhaust fumes from traffic in towns and cities to be a very serious or serious problem. This was the first increase since 2009, the lowest figure being in 2012 at 44% (Chart 31).

Drivers were more likely to say that they considered exhaust fumes from traffic in towns and cities to be a very serious/serious problem than non drivers, although this was not significantly different (51% and 48% respectively).
A large majority of respondents disapprove of drink driving: 85% of respondents agree or strongly agree that someone should not drive if they have drunk any alcohol, and 79% agree or strongly agree that most people don’t know how much they can drink before being over the legal drink drive limit.

Chart 33: Attitudes towards drink driving [ATT0346 - ATT0347]

If someone has drunk any alcohol they should not drive

Road safety and mobile phone use

When asked about a range of statements about driving and mobile phones:

- **87%** disagree that it is perfectly safe to talk on a hand-held mobile phone while driving.
- **67%** agree that the law on using mobile phones whilst driving is not properly enforced.
- **57%** agree that all use of mobiles while driving, including hand-free kits is dangerous.
- **45%** agree that all use of mobiles while driving, including hand-free kits should be banned.

A majority of respondents think that all use of mobile phones while driving is dangerous, and even more disagree that it is perfectly safe. Moreover, women are significantly more likely than men to agree with the fact that mobile phone use while driving is dangerous (62% compared to 51%).

Other sources

Chart 35: Attitudes towards the use of mobile phones while driving [ATT0349 - ATT0352]
Attitudes on road safety

Chart 36: Proportion who agree or strongly agree with statements on the use of mobile phones while driving by gender

All use of mobile phones while driving, including hands-free kits...

- ... is dangerous
  - Men: 51%
  - Women: 62%

- ... should be banned
  - Men: 40%
  - Women: 49%

Attitudes towards the use of mobile phones vary between age groups. The oldest age group (65+) is significantly more likely to agree that all use of mobile phones while driving should be banned than younger age groups (18-54). They are also more likely to think that the law on mobile phones whilst driving is not properly enforced compared to the youngest age group (18-34).

Chart 37: Proportion who agree or strongly agree with statements on the use of mobile phones while driving by age

- All use of mobile phones while driving, including hands-free kits is dangerous
- All use of mobile phones while driving, including hands-free kits should be banned
- The law on mobile phones whilst driving is not properly enforced
Road safety and speed cameras

Overall, 88% of people agree that people should drive within the speed limit, and a majority (55%) agree that speed cameras save lives. However, about half (49%) agree that speed cameras are mostly there to make money and over a third (36%) think that there are too many of them. Half of respondents also agree that average speed cameras are preferable to fixed speed cameras, although a higher proportion of respondents (8%) can’t choose an answer to this question compared with the other questions (with responses around 2%), which might reflect less knowledge about the way speed cameras work.

Chart 38: Attitudes towards speeding and speed cameras [ATT0353 - ATT0357]

While agreement with the general statement that people should drive within the speed limit has remained broadly stable over the last decade (around 90%), opinions on speed cameras have changed. The proportion of people who think that speed cameras save lives has increased, while the proportion of people who think that speed cameras are mostly there to make money, or that there are too many of them, has decreased (although changes from 2013 are not significant).

Chart 39: Proportion who agree with statements on speed cameras, 2004 to 2014 [ATT0354 - ATT0356]
While women are significantly more likely to think that speed cameras save lives, men are significantly more likely to believe that there are too many speed cameras or that they are mostly there to make money. Preference of average over fixed speed cameras is more similar by gender, although women are significantly more likely not to answer or have a neutral opinion.

**Residential streets**

Respondents’ attitudes to closing residential streets to through traffic have varied over time. In 2004, nearly half the respondents were in favour of closing residential streets to through traffic. In 2014, 34% of respondents were in favour of closing residential streets to through traffic. This was not significantly different to the 2013 figure (32% in favour).

In 2014, 73% were in favour of having 20 miles per hour speed limits in residential streets, this figure is significantly different to the 68% in favour in 2013. Attitudes towards speed bumps to slow down traffic in residential areas have peaked in 2014, with 54% of respondents in favour. This was significantly different to the 2013 figures of 45%. The number of respondents opposed to speed bumps in residential streets has also declined from 34% in 2013 to 30% in 2014.

**Chart 41: Attitudes towards traffic calming measures on residential streets** [ATT0358 - ATT0360]
Attitudes towards traffic calming measures in residential streets vary between drivers and non-drivers; around 83% of non-drivers were more favourable towards having 20mph speed limits in residential streets compared to 69% of drivers. By contrast, a greater number of drivers were against the use of speed bumps in residential areas (36% of drivers compared to 17% of non-drivers).

The proportion of females in favour of having speed bumps in residential areas was significantly higher than among males (60% and 46% respectively).

Men were more likely to be against having speed limits of 20mph in residential streets compared to woman (18% and 11% respectively) whilst woman were more in favour (75%) compared to men (70%).

There are some differences in opinions about residential streets by age group. The 65 and over age group were more likely to be in favour of closing residential streets to through traffic whilst also being more likely to be against having speed bumps to slow down traffic in residential streets. In contrast, the younger age group were more likely to be in favour of having speed bumps in residential areas (66%) compared to any other age group.
The British Social Attitudes Survey

The British Social Attitudes survey is a representative household survey of adults aged 18 and over, which collects data on public attitudes towards a range of topics through a combination of face-to-face interviews and self-completion questionnaires.

The British Social Attitudes survey is managed and conducted by NatCen Social Research and contains questions sponsored by a number of organisations including Government Departments. This document contains results for the questions sponsored by the Department for Transport. The NatCen British Social Attitudes Survey report can be found on their website.

This report was prepared by Delphine Robineau and Davita Patel, statisticians in the Department for Transport. Please email attitudes.stats@dft.gsi.gov.uk with technical enquiries about this report.

Detailed statistical tables

Methodology

The sampling frame is the Postcode Address File (PAF) and is limited to those living in private households. The sampling method uses a multi-stage design with three separate stages selecting postcode sectors, addresses and individuals. The survey is weighted to correct for the unequal selection of addresses, dwelling units and individuals and biases caused by differential non-response.

In 2014, respondents were randomly allocated to one of three self-completion modules (A, B and C). Thus the sample size for certain questions varies depending on which module(s) they featured in.

Fieldwork was carried out between July and September 2014, with a small number of interviews taking place in October and November.

Further information

The achieved sample size for the 2014 face-to-face interviews was 2,878 respondents. This equates to a response rate of 47%. Of the 2,878 face to face survey respondents, 792 completed self-completion module A, 796 completed self-completion module B and 788 completed self-completion module C.

All results presented here are weighted and any differences in results between 2013 and 2014 are statistically significant at the five per cent level of confidence using an estimated design factor (DEFT) of 1.2.
