Instructions For Use

Hercules Fuel Discrepancy Reconciliation Chart

The MOD Form 799/4B(Hercules) is used by personnel undertaking a refuel/defuel to determine the fuel discrepancy.

Example: The aircraft gauges give an increased reading of 20,000 lb but the refueller actually put in 19,400 lb. The discrepancy is 600 lb.

1. Read along the base line until the figure of 20,000 is reached.
2. Read up the left hand side until the figure of 600 is reached, follow this point across the page until it meets the vertical point at the 20,000 lb mark.
3. Read off the nearest percentage line, which in this case will be 3 per cent.

Note: Should the point being traced from left to right meet the imaginary vertical line before crossing the 6 per cent line, then the discrepancy is greater than 6 per cent and is to be reported to the NCO IC Maintenance.
