1 Introduction

1.1 This note is issued by the Secretary of State, the Welsh Assembly Government (WAG) and the Scottish Ministers ("the Government") to give guidance on the conditions appropriate for the control of emissions into the air from the following industrial sector:

Vegetable Oil Extraction and Fat and Oil Refining processes / installations\(^1\). It supersedes guidance note Vegetable Oil Extraction and Fat and Oil Refining Processes 6/25 (97) published in February 1997

1.2 This is one of a series of notes giving guidance on Best Available Techniques (BAT) and Best Available Techniques Not Entailing Excessive Cost (BATNEEC)\(^2\). The notes are all aimed at providing a strong framework for consistent and transparent regulation of installations.

General guidance setting out LA-PPC policy and procedures is contained in the “General Guidance Manual on Policy and Procedures for A2 and Part B installations” available from [www.defra.gov.uk/environment/ppc/index.htm](http://www.defra.gov.uk/environment/ppc/index.htm) referred to in this document as the “General Guidance Manual”. Other related guidance can be found in Section 8 of this document.

1.3 This note is for use under both Local Air Pollution Control (LAPC) established by Part I of The Environmental Protection Act 1990, and Local Air Pollution Prevention and Control (LAPPC) established by the Pollution Prevention and Control Act 1999. It constitutes statutory guidance to regulators under regulation 37 of The Pollution Prevention and Control (England and Wales) Regulations 2000, SI 1973\(^3\). To the extent it provides guidance on techniques, it also constitutes statutory guidance to regulators under section 7(11) of the 1990 Act, and in any event regulators are expected to have regard to it. The note will be treated as one of the material considerations when determining any appeals made against a decision under either the 1990 or 1999 Acts. This note also includes mandatory requirements contained in the EU Solvent Emissions Directive (SED) as explained in paragraphs 1.12, 1.13, 1.14, 1.15, 1.16, 1.17 and 1.18 below.

Who is affected

1.4 This guidance is for:

- regulators: who must have regard to the guidance when determining applications and reviewing extant authorisations and permits
- operators: who are best advised also to have regard to it when making applications, and in the subsequent operation of their process
- members of the public: who may be interested to know what the Government considers (in accordance with the legislation) amounts to appropriate conditions for controlling air emissions for the generality of processes in this particular industry sector

---

1. The term "process(es)" is used in the remainder of the note to mean both "processes" under the Environmental Protection Act 1990 and "installations" under the Pollution Prevention and Control Act 1999.

2. BATNEEC is the formulation used in the Environmental Protection Act 1990 and BAT is used in the Pollution Prevention and Control Act 1999. For the purpose of this guidance note, the two concepts are regarded as having essentially the same effect.

1.5 **Section 3** of this note advises on which type of activities/processes it covers.

1.6 In **Section 1** of this note the distinction is made between organic solvent consumption of a PPC installation and organic solvent consumption of a SED activity. In the situation described in the following paragraph this affects which of the remaining parts of the note apply. (The rest of the note refers only to organic solvent consumption of the installation).

1.7 It is possible that in a very few cases the organic solvent consumption of the PPC installation could exceed the threshold in the PPC regulations, but the organic solvent consumption of the SED activity carried out at that installation is below the threshold where SED applies. This is because of the different methods of calculating consumption (See **Section 8 Definitions**).

If an operator can show that these circumstances occur in a particular case, the requirements of the SED boxes within the note will not apply.

1.8 For those activities/processes covered, not all paragraphs of the note will apply in every case.

**Table 1** sets out which paragraphs apply.

**Table 1** applies in specific circumstances, as follows:

To any activity to extract vegetable oil from seeds and other vegetable matter, the processing of dry residues to produce animal feed, the purification of fats and vegetable oil derived from seeds, vegetable matter and/or animal matter

1.9 In interpreting **Table 1**, the following are relevant:

"SED activity" is one that is covered by the SED - this will be determined by the description of the activity (see Annex I of the Directive in **Appendix 2** of this note) together with the organic solvent consumption (see Annex IIA of the Directive in **Appendix 2**, and the determination method in paragraph 5.5 of this note).

The definitions of the different types of "SED activity" can then be used to determine if "single SED activity" and "more than one SED activity" exist within the installation.

1.10 This note includes SED boxes. These are provided to specifically detail the additional requirements of the Directives for this particular sector. Where they apply, these are mandatory.

1.11 In **Section 5** and **Section 6**, arrows are used to indicate the matters which should be considered for inclusion as authorisation and permit conditions. It is important to note, however, that this should not be taken as a short cut for regulators to a proper determination of BATNEEC and BAT or to disregard the explanatory material which accompanies the arrows, and that in individual cases it may be justified to:

• include additional conditions
• include different conditions
• not include conditions relating to some of the matters indicated

In addition, conditions will need to be derived from other parts of the note, in particular to specify emission limits, compliance deadlines and mandatory requirements arising from directions or other legislation.
1.12 The note also (where appropriate) gives details of any mandatory provisions affecting emissions, which are in force at the time of publication. The main difference between this note and previous notes is the inclusion of requirements specified in EC Directive 1999/13/EC, from here on referred to as the Solvent Emissions Directive (SED).

1.13 The SED was adopted by the European Commission on 11 March 1999. Its aim is to reduce emissions of volatile organic compounds (VOC) from specified industrial processes. In order to achieve this in the UK, the Directive is being implemented through the Environmental Protection Act 1990 and the Pollution Prevention and Control Regulations 2000. As a result, the regulators have been directed through Directions from DEFRA to include the requirements of the Directive and the time scales by which these must be complied with (see ref. 1).

Not all the processes/activities that this note applies to, are necessarily subject to the requirements of the Directive. It is only those Directive Installations, as defined in Annex I and IIA of the SED see (Appendix 2) that are subject to the requirements of the Directive.

It is believed that all processes/activities that this note applies to, are subject to the Directive.

1.14 In order to reduce VOC emissions from Directive Installations, compliance with the total emission limit is required.

In addition, the Directive requires that, where an operator is using a substance or preparation which contains VOC and the nature or amount of VOC means that the substance or preparation is assigned one, or more, of the risk phrases R45, R46, R49, R60, R61.

(a) that substance or preparation must be changed so that the risk phrases no longer apply (e.g. by substituting the VOC), and/or
(b) emissions of VOC in question are controlled

Additional requirements also apply to the use of halogenated VOC assigned risk phrase R40.

1.15 This note relates to all releases to air from the activity/process, and for SED installations it relates to all VOC releases to all media. However, not all of the paragraphs apply. The type and way VOC are used will dictate which paragraphs of the note apply.
1.16 The Directions\textsuperscript{4} came into force on 22 March 2002 in England and Wales and 1 March 2002 in Scotland. They were made for the purpose of implementing the EC Directive 1999/13/EC on the limitation of emissions of VOC due to the use of organic solvents in certain activities and installations (SED). These Directions relate to certain processes/activities subject to local regulatory control under Part 1 of the Environmental Protection Act 1990 and the Pollution Prevention and Control Act 1999, some of which are covered by this note. Regulators are required to comply with the Directions without discretion. Compliance by SED activities with the requirements of paragraphs 5.2, 5.3, 5.5, 5.7, 5.11, 5.12, 5.13 of the note and SED Boxes 1-11 will ensure implementation of the Directive provisions. \textbf{Section 6}. Control techniques, details practical techniques that, at the time of writing, are considered to be BAT/BATNEEC.

1.17 The previous PG note incorporated many of the aspects of the SED, hence in some cases minimal time and investment will be required to meet the Directive provisions.

Existing installations have until 31 October 2007 to meet the majority of the requirements of the Directive.

(Existing installations may choose to convert to the SED requirements at any time before the specified compliance date within the Direction.) However, the requirements for new abatement plant must be met straight away. In addition,

---

\textsuperscript{4} The Environmental Protection Act (Solvent Emissions Directive) (England) Direction 2002
Pollution Prevention and Control (Solvent Emissions Directive) (England and Wales) Direction 2002
The Environmental Protection Act (Solvent Emissions Directive) (Scotland) Direction 2002
Pollution Prevention and Control (Solvent Emissions Directive) (Scotland) Direction 2002
emissions of designated risk phrase materials assigned certain risk phrases, (SED Box 6) are required to be controlled and in specific cases the compounds should be replaced with less harmful substances within the shortest possible time (see Section 8, Definitions). New or substantially changed installations need to meet all the requirements of the SED prior to operation.

1.18 The SED gives limited discretion to Member States to adopt different measures if the Directive requirements are demonstrated not to be technically and economically feasible. Any such alternative measures would need to be clearly justified and approved by the regulator. The operator must demonstrate to the satisfaction of the regulator that the best available technique is being used and that there are no significant risks to human health or the environment. Before the derogation is permitted for SED activities, the regulator must notify Defra and give full justification of each case where SED requirements, paragraphs 5.2, 5.3, 5.5, 5.7, 5.11, 5.12, 5.13 of the note and SED Boxes 1-11, are not applied. Defra’s view at the time of publication of this guidance is that, while each case must be considered by regulators on its merits and each notification by regulators will be carefully examined by Defra, this guidance note has been written to reflect what is BAT for the sector as a whole, and it is not envisaged generally that there will be a need for different measures to be adopted for reasons of technical and economical feasibility.

Site Specific BAT / BATNEEC

1.19 All processes are subject to BAT/ BATNEEC. In general terms, what is BAT/ BATNEEC for one process in a sector is likely to be BAT/ BATNEEC for a comparable process; but in each case it is, in practice, for regulators (subject to appeal) to decide what is BAT/ BATNEEC for the individual process and the regulator should take into account variable factors (such as configuration, size and other individual characteristics of the process) and the locality (such as proximity of particularly sensitive receptors5). Ultimately, therefore, what constitutes BAT/ BATNEEC is site specific but this guidance note comprises guidance for the generality of processes in the sector and careful regard should be had to it, in order to maximise consistency of permits as appropriate.

1.20 The guidance is based on the state of knowledge and understanding at the time of writing of:
• vegetable oil extraction and fat and oil refining processes/activities
• their potential impact on the environment; and
• what constitutes BAT/BATNEEC for preventing and reducing air emissions

1.21 The note may be amended from time to time in order to keep abreast with developments in BAT/BATNEEC including improvements in techniques and new understanding of environmental impacts and risks. Such changes may be issued in a complete revision of this document, or in separate additional guidance notes which address specific issues. (It may not always be possible to issue amending guidance quickly enough to keep in absolute step with rapid changes, which is another circumstance where paragraph 1.19 above might apply.)

1.22 Steps will be taken to ensure that those who need to know about changes are informed. Operators (and their advisers) are, however, strongly advised to check with the regulator whether there have been any changes before relying on this note for the purposes of making an application under the 1990 or 1999 Acts or making any other decisions where BAT/ BATNEEC may be a consideration.

5. Guidance on the relationship between BAT/BATNEEC and air quality objectives is contained in the General Guidance Manual on policy and procedures for A2 and B installations.
Consultation

1.23 This note has been produced in consultation with relevant trade bodies, representatives of regulators including members of the Industrial Pollution Liaison Committee, and other interested organisations.

Publication

1.24 This and the other published guidance in this series is available, free of charge, via Defra at www.defra.gov.uk. There are links to this site from the following websites:

- Scottish Executive at www.scotland.gov.uk.
- Scottish Environment Protection Agency at www.sepa.org.uk.

Printed copies of this and other PG notes are available from Defra Publications. They are priced separately and can be purchased in the following ways:

by writing to

Defra Publications, Admail 6000, London, SW1A 2XX.

Cheques or postal orders to cover the cost of priced items must be enclosed with your order, and should be made payable to 'Defra Publications'. See also the Defra Publications order form available from http://www.defra.gov.uk/corporate/publications/ordrform.htm.

or by telephoning

08459 556000 (calls charged at local rate) or +44 20 8957 5242 from outside the UK.

Debit and credit cards are accepted.

When ordering, always quote the title in full and the order code (PB XXXX) given. Further information on ordering can be found on the Defra website at www.defra.gov.uk/corporate/publications/ordering.htm

1.25 General guidance explaining LAPPC and setting out the policy and procedures, is contained in the “General Guidance Manual on Policy and Procedures for A2 and B Installations” available from www.defra.gov.uk/environment/ppc/index.htm, referred to in this document as the “General Guidance Manual.” This is designed for operators and members of the public, as well as for local authority regulators.

1.26 In addition to the General Guidance Manual referred to above, explanation or clarification of certain terms used in this sector guidance note may be found in a general guidance note issued under Part I of the Environmental Protection Act 1991: ‘Interpretation of terms used in process guidance notes’, known as General Guidance Note 4 - GG4 - published by HMSO in 1991. Where there is any conflict between GG4 and the guidance issued in this note or in the General Guidance Manual, the latter two documents should prevail, as should any subsequent guidance issued in relation to LAPPC.

Activities covered by note

1.27 PG 6/25 (04) relates to processes for:

(a) the extraction of oil from seeds and other vegetable matter, for example by expeller pressing and/or solvent extraction,
(b) the processing of dry residues from such processes to produce animal feed,
(c) the purification (refining) of fats and oils derived from seeds and vegetable matter and/or animal matter (including the removal of contaminants from waste oils or fats) whether at the site of extraction or undertaken as a separate operation.

More details of these processes can be found in the Process Description.
1.28 Directly associated and technically connected solvent processes/activities carried out within the same installation will form part of the activity and have to meet the provisions for that activity, unless defined as a separate activity within the SED (See Appendix 2). In which case they should be regarded as an additional activity within a single installation and the provisions of SED Box 10 apply.

1.29 Other relevant guidance notes for vegetable oil extraction and oil and fat refining processes are:
   • PG6/26 (1996) animal feed compounding (soon to be revised)
   • PG6/27 (1996) vegetable matter drying (soon to be revised)
2 Timetable for compliance and reviews

Existing processes or activities

2.1 The previous guidance advised that upgrading to the required standards should have been completed by 1 April 2001. Requirements still outstanding from any existing upgrading programme should be completed.

Upgrading to this note

2.2 The new provisions of this note, and the date(s) by which compliance with these provisions is expected, are listed in Table 2 below together with the paragraph number where the provision is to be found. Compliance with the new provisions should normally be achieved by the dates shown. Authorisations and permits should be varied as necessary having regard to the changes and the timetable. The SED requirements and time scales are mandatory.

</tr>
</tbody>
</table>

* Here and elsewhere in this note, this includes tanks containing any organic solvent or materials containing organic solvent

2.4 Where provisions in the preceding guidance note have been deleted or relaxed, authorisations should be varied as necessary as soon as reasonably practicable. Section 7 provides a summary of all changes.

## Relaxation of conditions

### SED Box 1 New VOC abatement plant

(article 5) All activities

All installations with, any VOC abatement equipment installed after 1 April 2001 must meet the emission limit requirements for New Installations of SED Box 5 and SED Box 6

### New processes or activities

2.5 For new processes or activities - as from the first day of operation following the publication of this revised guidance note, the authorisation / permit should have regard to the full standards of this guidance.

### SED Box 2 New Installations

(article 3) All Activities

For new installations the permit must have regard to the full standards of the Directive as from 1 April 2001.

## Substantially changed processes or activities

2.6 For substantially changed processes or activities - as from the first day of operation following publication of this revised guidance note the authorisation / permit should normally have regard to the full standards of this guidance with respect to the parts of the process/activity that have been substantially changed and any part of the process/activity affected by the change.
### SED Box 3 Substantially changed installations

(articles 2.4 & 9) All Activities

- For substantially changed (as defined in Article 2 of SED (Appendix 2) installations the permit must have regard to the full standards of the Directive as from the first day of April 2001.

Where an installation:
- undergoes a substantial change; or
- comes within the scope of this Directive for the first time following a substantial change

that part of the installation which undergoes the substantial change shall be treated as new installation.

However, if the following condition is met, then the change should not be considered substantial and an application for a non-substantial variation should be made.

The total mass emission of VOC from the SED installation after the substantial change is less than:
- the total mass emission of the installation prior to the change (which would have been described as substantial);  
  PLUS
- the calculated additional mass emission of the change part (which would have been described as substantial) of the installation if it had complied with the appropriate 31 October 2007 VOC requirements (i.e. those requirements being either emission and fugitive limits, or total emission limits, or the reduction scheme, as appropriate).

When determining a substantial change for SED installations, consideration must be given to the fact that:
- an increase in VOC emissions is required above the percentages set out below (SED Box 3); and
- that increase in emissions must have resulted from a change in nominal capacity of the installation

Under the SED a substantial change means:

For all installations a change of the nominal capacity leading to an increase of emissions of VOC of more than 10%. Any change that may have, in the opinion of the competent authority, significant negative effects on human health or the environment is also a substantial change.

Following a substantial change, compliance must be re-verified.

### Permit reviews

#### Reviewing permits

2.7 Under LAPC the requirement is to review conditions in authorisations at least every four years. (Section 6(6) Environmental Protection Act 1990).

2.8 Under LAPP the legislation requires permits to be reviewed periodically but does not specify a frequency. It is considered for this sector that a frequency of once every six years ought normally to be sufficient for the purposes of Regulation 15(1) Pollution Prevention and Control Regulations 2000.

More frequent review may be necessary in individual cases for the reasons given in Regulation 15(2). Further guidance on permit reviews is contained in the “General Guidance Manual on Policy and Procedures for A2 and B Installations” available from [www.defra.gov.uk/environment/ppc/index.htm](http://www.defra.gov.uk/environment/ppc/index.htm) to be referred to in this document as the “General Guidance Manual.” Regulators should use any opportunities to determine the variations to authorisations/permits necessitated by paragraph 2.2 above in conjunction with these reviews.

2.9 Under both LAPC and LAPP, conditions should be reviewed where complaint is attributable to the operation of the process and is, in the opinion of the regulator, justified.
### 3 Process description

#### Regulations

3.1 Vegetable oil extraction and fat and oil refining processes/installations are prescribed for:

- **LAPC** under section 6.9 of Schedule 1 to the Environmental Protection (Prescribed Processes and Substances) Regulations 1991, SI 472 (as amended).
- Processes for treating and processing materials intended for the production of food products from -
  
  1. animal raw materials (other than milk) at plant with a finished product production capacity of more than 75 tonnes per day;
  2. vegetable raw materials at plant with a finished product production capacity of more than 300 tonnes per day (average value on a quarterly basis)

Will be subject to Integrated Pollution Prevention and Control, IPPC, for which separate guidance will be issued until such control is in place this guidance should apply.

3.2 This note refers to:

(a) the extraction of oil from seeds and other vegetable matter, for example by expeller pressing and/or solvent extraction,

(b) the processing of dry residues from such processes to produce animal feed,

(c) the purification (refining) of fats and oils derived from seeds and vegetable matter and/or animal matter (including the removal of contaminants from waste oils or fats) whether at the site of extraction or undertaken as a separate operation.

In the rest of this section only “process” should be understood to describe the various stages involved in the vegetable oil extraction and fat and oil refining operations. It does not necessarily have the same meaning as elsewhere in this note.

3.3 In the context of this note, "process" or “activity” comprises the whole process from receipt of raw materials via production of intermediates to dispatch of finished products, including the treating, handling and storage of all materials and wastes relating to the process.

**Seed Oil Extraction Processes**

3.4 N.B. The numbers in brackets relate to the schematic diagram for crushing.

**General**

3.5 The crushing process involves the mechanical removal of oil from seeds using expellers, followed by the extraction of the residual oil using a solvent. Seeds with low oil contents (principally soyabean) can be extracted directly following adequate preparation.

**Loading/unloading, transport, drying and storage (1)**

3.6 Normally the seed is delivered in the dried condition. Where required to avoid storage problems and quality losses, the moisture content of the seed is adjusted to the required level by drying. The seed is stored and transported in bulk. At the place of use it is unloaded by means of grabs, bucket elevators, aspiration equipment or chutes, freed from dust and coarse foreign matter in screens, cyclone and magnetic separators before being fed to the storage silo's by chain conveyors, for instance. In-plant transfer of the moist oil seed and meal is generally accomplished by means of mechanical conveying equipment (e.g chain conveyors).

---

Pretreatment and pressing (2 and 3)

3.7 The first step in the process is to remove extraneous matter (e.g., chaff, stones, metal) from the incoming seed utilising sieves, magnets etc.

3.8 Dependant upon the seed being processed, various types of grinding, cracking, flaking and rolling equipment is used to rupture oil cells to allow egress of the oil. In the case of soyabees, the husks and hulls can also be removed by cracking and air classification, prior to flaking.

3.9 In order to further improve oil recovery during the process, all seeds are heated, typically using indirect steam, to condition and/or dry the material to a required moisture level prior to expelling (or flaking in the case of soyabees).

3.10 Some products complete their processing at this stage and are marketed as expelled cake and expelled oil.

Extraction (4, 5, 6 and 7)

3.11 However, in the majority of cases, the residual oil in the expelled cake is extracted using hexane. Cake is washed with solvent, under a counter current flow, producing an oil/solvent mixture (termed a miscella) and a residual meal containing solvent.

3.12 The miscella is subjected to evaporation and steam stripping to recover the hexane from the oil. The hexane is then separated from the water mixture by physical settlement and is recovered for re-use in the extraction operation.

3.13 At this stage, a crude oil has been produced which may either be refined on site or sold to another operator for refining.

3.14 The solvent-laden meal is processed by steam distillation in a desolventiser to recover most of the hexane content. The meal is then dried and cooled before storage in silo's or loading, and may be sold as animal feed in this state or may be further processed by grinding prior to sale.
3.15 N.B. The numbers in brackets relate to the schematic diagram for refining.

**General**

3.16 Crude oils and fats, which are obtained by expelling, extraction, or rendering contain substances and trace components, which are undesirable for taste, stability, appearance or further processing. These substances and trace components include seed particles, impurities, phosphatides, carbohydrates, proteins, traces of metals, pigments, waxes, oxidation products of fatty acids, and polycyclic aromatic hydrocarbons (heavy and light) and pesticide residues.

3.17 The purpose of refining oils and fats for edible purposes is to remove these undesirable substances and components while maintaining the nutritional value and the stability of the end product.
Refining

Degumming (8)

3.18 The first step of chemical refining is degumming. Its purpose is to remove seed particles, impurities, and (partly) phosphatides, carbohydrates, proteins and traces of metals.

3.19 The crude oil is treated with foodgrade processing aids and/or water, which leads to hydration of the main part of the phosphatides, proteins, carbohydrates and traces of metals. The hydrated material precipitates from the oil and can be removed by centrifugation.

Neutralisation (9)

3.20 Alkali neutralisation reduces the following components: free fatty acids, oxidation products of free fatty acids, residual proteins, carbohydrates, traces of metals and a part of the pigments.

3.21 The treatment consists of the reaction with an alkali-solution. By this treatment a second phase is formed (soap stock), in which phase the undesired substances are dissolved. This phase is separated and removed, for example by centrifuging the mixture. The recovered soapstock may be sold or acid-split on site to produce by-products for use in the animal feed or soap industry.

3.22 The neutral oil is usually washed after initial separation to remove any residual soap and dried.

Bleaching (10)

3.23 The purpose of bleaching is to reduce the levels of pigments such as carotenoids and chlorophyll, heavy polycyclic aromatic hydrocarbons, but also residues of phospholipids, soaps, traces of metals and oxidation products. These substances are removed by adsorption with activated clay, silica and/or activated carbon. The bleaching clay containing all these substances is separated by filtration.

Deodorization/stripping (11)

3.24 The purpose of deodorization/stripping is to reduce/strip out free fatty acids and to remove odours, off-flavours and other volatile components such as pesticides and light polycyclic aromatic hydrocarbons.

Modification Processes

3.25 The physical characteristics (e.g. hardness, melting profile) of oils, fats and blends can be adjusted to meet customer requirements by means of Modification processes. The modification techniques used are hydrogenation, interesterification or fractionation.

Hydrogenation (12)

3.26 The basis of Hydrogenation is the addition of hydrogen to unsaturated fatty acids to create saturated fats with a higher melting point. Oils can be either partially or fully hydrogenated.

Interesterification/esterification (13)

3.27 Interesterification is a process where different oils are combined to produce a fat with different melting characteristics. This process involves the separation of triglycerides into fatty acids and glycerol followed by recombination.
Fractionation (15)

3.28 In fractionation an oil is cooled under controlled conditions. This separates the high melting point triglycerides in the oil from the low melting point triglycerides, leaving the fat in two parts or “fractions”, one of which is more solid than the other at room temperature.

Dewaxing (15)

3.29 Some oils like sunflower oil contain waxes, which crystallise at low temperatures and give to the oil a turbid appearance. To remove these waxes, different procedures are applied. They all have in common the low temperatures at which the waxes crystallise.

Process or activity

4 Potential releases

Pollutants and sources

4.1 The key emissions from these processes/activities that constitute pollution for the purposes of Part I of the Environmental Protection Act 1990 or the Pollution Prevention and Control Regulations 2000 and therefore warrant control are those consisting of:

VOC, particulate matter, carbon monoxide and oxides of nitrogen

4.2 The following parts of the process/activity may give rise to releases of VOC

• handling, loading and mixing processes involving organic solvents
• solvent extraction processes
• refining and associated processes
• degumming

4.3 The following parts of the process/activity may give rise to releases of particulate matter

• handling and loading of dusty materials
• screening materials
• drying materials
• preparation and drying
• crushing

4.4 The following parts of the process/activity may give rise to releases of carbon monoxide and nitrogen oxides

• oxidation of extracted gases
• combustion of extracted gases in turbines, reciprocating engines, or boilers
5 Emission limits, monitoring and other provisions

Non-VOC provisions

5.1 All processes/activities should comply with the emission limits and provisions with regard to non-VOC releases in Table 4.

Compliance overview

5.2 For VOC existing installations should apply the provisions of:

- Emission Limits in Table 5

In addition to the above, for SED installations, the requirements of the emission limits and conditions for certain designated risk phrase materials (SED Box 6) must be met.

New and substantially changed SED installations, and by the 31 October 2007 existing SED installations should apply the provisions of:

- Total Emission Limit Values SED Box 5; or

In addition to the above, the requirements of the emission limits and conditions for certain designated risk phrase materials (SED Box 6) must be met.

5.3 The provisions described in this Section are achievable using best available techniques described in Section 6.

- The reference conditions for limits in Section 5 are: 273.15K, 101.3kPa, without correction for water vapour content, unless stated otherwise.

## Compliance with the Total Emission Limit Values

Compliance with Total Emission Value per unit of input material is achieved if:

- the total emission of solvent (E) (in kilograms) divided by the mass input of material (in tonnes) is less than or equal to the Total Emission Limit Value above for that process

Where:

Total Emission of Solvent (E) = Fugitive Emission (as determined in accordance with SED Box 9) (F) + O<sub>1</sub> Emission in waste gases (as determined in accordance with SED Box 8)

Compliance is achieved if:

\[
\frac{E}{\text{mass of input of material processed (tonnes)}} = \text{or} < \text{Total Emission Limit Value}
\]
Determination of Solvent Consumption

5.4 Construction of inventories of materials consumed and disposed of may involve the identification of individual organic solvents, or solids. This may give rise to an issue of commercial confidentiality. Information supplied must be placed on the public register, unless exclusion has been granted on the grounds of commercial confidentiality or national security. (Further guidance can be found in chapter 8 of the General Guidance Manual on policy and procedures for A2 and B installations)

5.5 A determination of the organic solvent consumption, the total mass of organic solvent inputs minus any solvents sent for reuse/recovery off-site, should be made and submitted to the regulator annually, preferably to coincide with the operators stocktaking requirements, in the form of a mass balance in order to determine the annual actual consumption of organic solvent (C):

\[
C = I_1 - O_8
\]

Where: 

- \( I_1 \): Total quantity of organic solvents, or their quantity in preparations purchased which are used as input into the process/activity.

A calculation of the purchased organic solvent input (\( I_1 \)) to the process/activity, is carried out by recording:

(i) The mass of organic solvent contained in raw materials and preparations in the initial stock (IS) at the start of the accounting period; plus

(ii) The mass of organic solvent contained in raw materials and preparations in the purchased stock (PS) during the accounting period.

(iii) Minus the mass of organic solvent contained in raw materials and preparations in the final stock (FS) at the end of the accounting period.

Total Organic Solvent Input (\( I_1 \)) = IS + PS – FS

Solvent Management Plan

5.6 The Solvent Management Plan provides definitions and calculations to demonstrate compliance with the VOC requirements of this note. The use of the standard definitions and calculations also ensures consistency of VOC compliance across installations with an industrial sector.

5.7 The definitions provided must be used in all calculations relating to the Solvent Management Plan (SMP) (Figure 5.1).

- For SED installations using the total emission limit values, the SMP should be used to determine the total emission and the organic solvent input annually (SED Box 5)

Definitions:

The following definitions provide a framework for the mass balance calculations used in determining compliance.

Inputs of Organic Solvent in the time frame over which the mass balance is being calculated (\( I \))

\( I_1 \): The quantity of organic solvents, or their quantity in raw materials and preparations purchased which are used as input into the process/activity (including organic solvents used in the cleaning of equipment, but not those used for the cleaning of the products).

\( I_2 \): The quantity of organic solvents or their quantity in raw materials and preparations recovered and reused as solvent input into the process/activity. (The recycled solvent is counted every time it is used to carry out the activity.)
Outputs of Organic Solvents in the time frame over which the mass balance is being calculated (O)

O₁ Emissions in waste gases.

O₂ Organic solvents lost in water, if appropriate taking into account waste water treatment when calculating O₅.

O₃ The quantity of organic solvents which remains as contamination or residue in products output from the process/activity.

O₄ Uncaptured emissions of organic solvents to air. This includes the general ventilation of rooms, where air is released to the outside environment via windows, doors, vents and similar openings.

O₅ Organic solvents and/or organic compounds lost due to chemical or physical reactions. (including for example those which are destroyed, e.g. by thermal oxidation or other waste gas or waste water treatments, or captured, e.g. by adsorption, as long as they are not counted under O₆, O₇ or O₈).

O₆ Organic solvents contained in collected waste.

O₇ Organic solvents, or organic solvents contained in preparations, which are sold or are intended to be sold as a commercially valuable product.

O₈ Organic solvents contained in preparations recovered for reuse but not as input into the process/activity, as long as not counted under O₇.

O₉ Organic solvents released in other ways.
Figure 5.1: Solvent Management Plan Inputs and Outputs

Solvent management plan
Consumption = \( I_1 \cdot O_8 \)
Actual solvent emission = \( I_1 \cdot O_5 \cdot O_6 \cdot O_7 \cdot O_8 \)
Fugitive emission (F) = \( I_1 \cdot O_1 \cdot O_5 \cdot O_6 \cdot O_7 \cdot O_8 \)
or \( F = O_2 + O_3 + O_4 + O_9 \)

Solvent Emission Directive (SED) activities
Fugitive emission value = \( F \cdot \frac{I_1}{I_1 + I_2} \) x 100%
Total emission = \( O_1 + \) Fugitive emission (F)

### SED Box 6 SED requirements for Designated Risk Phrase Materials

**(articles 5, 7, 8, 9)**

#### All Activities using Designated Risk Phrase Materials

Designated Risk Phrase Materials used in SED installations must be either replaced, controlled and or limited, as set out below.

#### All SED Installations.

**i.e. existing, new and substantially changed**

<table>
<thead>
<tr>
<th>Row</th>
<th>Designated Risk Phrase Materials with risk phrases R45, R46, R49, R60, R61</th>
</tr>
</thead>
</table>
| 1   | **Requirements**  
|     | • Replace as far as possible (taking into account guidance under article 7(1) of the SED. See Appendix 2) by less harmful substances or preparations  
|     | • Control under contained conditions as far as technically and economically feasible to safeguard public health and the environment. Normally, in accordance with the guidance provided within Section 6 of the note  
|     | • Limit where the sum of the mass flows of all the discharges of all the compounds causing the risk phrase labelling is greater or equal to 10 g/h, a limit value of 2 mg/Nm³ for the mass sum of the individual compounds must apply |
|     | **Monitoring / timescales**  
|     | • Existing installations must comply within the shortest possible time  
|     | • New and substantially changed installations must comply from 1 April 2001  
|     | • Existing installations must comply by 31 October 2007  
|     | • New and substantially changed installations must comply from 1 April 2001 |

### Halogenated VOC with risk phrase R40

| 2   | **Requirements**  
|     | • Control under contained conditions as far as technically and economically feasible to safeguard public health and the environment. Normally, in accordance with the guidance provided within Section 6 of the note  
|     | • Limit where the sum of the mass flows of all the discharges of all the compounds causing the risk phrase labelling is greater or equal to 100 g/h, a limit value of 20 mg/Nm³ for the mass sum of the individual compounds must apply |
|     | **Monitoring / timescales**  
|     | • Existing installations must comply by 31 October 2007  
|     | • New and substantially changed installations must comply from 1 April 2001  
|     | • Existing installations must comply by 31 October 2007  
|     | • New and substantially changed installations must comply from 1 April 2001 |

**Annual manual extractive testing See paragraphs 5.18, 5.19, 5.20, 5.21, 5.22 and SED Box 8**

**N.B.** Substances or preparations or halogenated VOC which have been assigned as designated risk phrase materials, since 29 March 1999, or which are assigned as designated risk phrase materials in future must apply the replace, control and limit requirements, above within the shortest possible time from the date at which substances or preparations or halogenated VOC became/become designated risk phrase materials.

In determining the Shortest Possible Time, the operator will need to justify their timetables taking into account the following four factors contained within the SED:

- fitness for use;
- potential effects on human health;
- potential effects on the environment; and
- the economic consequences, in particular the costs and the benefits of the options available

For details of risk phrases see references i and j
Other Provisions

**Monitoring, investigation and recording**

5.8 The need for and scope of testing and the frequency and time of sampling depend on local circumstances, operational practice, and the scale of operation. As part of proper supervision the operator will monitor emissions, make tests and inspections of the process/activity and keep records, in particular:

- The operator should keep records of inspections, tests and monitoring, including all non-continuous monitoring, inspections and visual assessments. In such cases:
  - current records should be kept on site and made available for the regulator to examine
  - records should be kept by the operator for at least two years

5.9 The regulator needs to be informed of monitoring to be carried out and the results; the results should include process conditions at the time of monitoring.

- The process operator should provide a list of key abatement plant and should have a written plan for dealing with its failure, in order to minimise any adverse effects.

- The operator should notify the regulator at least 7 days before any periodic monitoring exercise to determine compliance with emission limit values. The operator should state the provisional time and date of monitoring, pollutants to be tested and the methods to be used.

- The results of non-continuous emission testing should be forwarded to the regulator within 8 weeks of the completion of the sampling.

- Adverse results from any monitoring activity (both continuous and non-continuous) should be investigated by the operator as soon as the monitoring data has been obtained/received. The operator should:
  - identify the cause and take corrective action
  - record as much detail as possible regarding the cause and extent of the problem, and the action taken by the operator to rectify the situation
  - re-test to demonstrate compliance as soon as possible; and
  - notify the regulator

**Visible and odorous emissions**

5.10 Visible and odorous emissions should be limited and monitored as follows. Abnormal emissions require action as described in the “Abnormal events” paragraph below.

- Emissions from combustion processes should in normal operation be free from visible smoke and in any case should not exceed the equivalent of Ringelmann Shade 1 as described in British Standard BS 2742:1969.

- All releases to air, other than condensed water vapour, should be free from persistent visible emissions.

- All emissions to air should be free from droplets.

- There should be no offensive odour beyond the site boundary, as perceived by the regulator.

**Abnormal events**

5.11 The regulator needs to be notified about certain events, whether or not there is related monitoring showing an adverse result, and the operator should respond to problems which may have an adverse effect on emissions to air.

- In the case of abnormal emissions, malfunction or breakdown leading to abnormal emissions the operator must:
  - investigate immediately and undertake corrective action
  - adjust the process or activity to minimise those emissions; and
  - promptly record the events and actions taken
The regulator must be informed without delay:
- if there is an emission that is likely to have an effect on the local community
- in the event of the failure of key abatement plant, for example, bio scrubber, thermal oxidiser units

### SED Box 7 Non compliance causing immediate danger

(article 10) All Activities

In cases of non-compliance causing immediate danger to human health, operation of the activity must be suspended.

All of following criteria should be taken into account:
- the toxicity of the substances being released
- the amount released
- the location of the installation; and
- the sensitivity of the receptors

### Start up and Shut down

5.12 Higher emissions may occur during start-up and shut-down of a process. These emissions can be reduced, by minimising, where possible, the number of start-ups and shut-downs and having adequate procedures in place for start-up, shut-down and emergency shut-downs.

- All appropriate precautions must be taken to minimise emissions during start-up and shutdown.

### Efficient capture of emissions

5.13 Exhaust flow rates of waste gases must be consistent with efficient capture of emissions, good operating practice and meeting the requirements of the legislation relating to the workplace environment.

- The introduction of dilution air to achieve emission concentration limits must not be permitted.
- Dilution air may be added for waste gas cooling or improved dispersion where justified, but this must not be considered when determining the mass concentration of the pollutant in the waste gases.

### Continuous indicative monitoring

5.14 Continuous indicative monitoring can be used as a management tool. In conjunction with continuous recording it identifies any trends in emissions; for example, that emissions are gradually increasing, which may indicate a need for maintenance. It can also be used with or without continuous recording to trigger an alarm when there is a sudden increase in emissions; for example, if abatement plant fails. For a given concentration of pollutant, the output level varies with the instrument. It should be noted that not all monitors provide a linear response to an increase in pollutant. The monitor should be set up to provide a baseline output when the plant is known to be operating under the best possible conditions; i.e. such that emissions are fully compliant with the requirements. The instrument manufacturer should be able to set an output level, which corresponds, to around 75% of the emission limit, to trigger alarms. Thus the alarms are activated in response to this significant increase in pollutant loading above the baseline, so that warning of the changed state is given before an unacceptable emission occurs.

### Particulate matter continuous monitoring abated releases

5.15 Where abatement equipment is required to comply with the particulate matter provisions of the note.

- Operations likely to generate particulate matter should be continuously monitored to indicate the performance of the abatement plant, by using equipment such as a pressure drop indicator.
Continuous monitoring VOC abated releases

5.16 Where continuous monitoring and recording is required to demonstrate compliance with the VOC requirements of the note. For existing VOC abatement equipment surrogate measurements for VOC are acceptable. Where new VOC abatement equipment is installed, or existing VOC abatement equipment is modified, or the operating conditions are changed, VOC monitoring should be carried out once more to demonstrate that the surrogate measurements are adequate to ensure compliance.

- Thermal oxidisers must have continuous monitoring and recording for VOC expressed as total carbon excluding particulate matter. After sufficient monitoring data has been collected to clearly demonstrate adequate VOC destruction continuous monitoring of temperature may be used as a surrogate measurement.
- Catalytic oxidisers must have continuous monitoring and recording for VOC expressed as total carbon excluding particulate matter. After sufficient monitoring data has been collected to clearly demonstrate adequate VOC destruction continuous monitoring of carbon monoxide and temperature may be used as a surrogate measurement. (It may be possible to waive the requirement for carbon monoxide monitoring, if the operator can demonstrate to the regulator that the catalytic oxidiser is designed in such a way that it can not exceed the carbon monoxide limit (see Non VOC Emission Limits))
- Bio scrubbers and reactors must have continuous monitoring and recording for VOC expressed as total carbon excluding particulate matter. After sufficient monitoring data has been collected to clearly demonstrate adequate VOC destruction continuous monitoring of the flow and pH of the re-circulating water, fan suction, exhaust temperature and pressure drop across the packing, coupled with daily monitoring of the nutrient may be used as a surrogate measurement.
- Turbines, reciprocating engines, boilers or any other form of VOC abatement equipment must have continuous monitoring and recording for VOC expressed as total carbon excluding particulate matter.

5.17 Where continuous monitoring is required, it should be carried out as follows:

- All continuous monitoring readings should be on display to appropriately trained operating staff.
- Instruments should be fitted with audible and visual alarms, situated appropriately to warn the operator of abatement plant failure or malfunction.
- The activation of alarms should be automatically recorded.
- All continuous monitors should be operated, maintained and calibrated (or referenced) in accordance with the manufacturers’ instructions. The relevant maintenance and calibration (or referencing) should be recorded, and such records made available for inspection by the regulator.
- All new continuous monitoring equipment should be designed for less than 5% downtime over any 3-month period.
5.18 Calibration and compliance monitoring should meet the following requirements as appropriate.

(i) where the Total Emission Limit Value option is adopted: no result should exceed the emission limits specified, except where either:
   (a) data is obtained over at least five sampling hours in increments of 15-minutes or less; or
   (b) at least twenty results are obtained where sampling increments of more than 15-minutes are involved

(ii) where the Emission Limits are adopted: no result should exceed the emission limit specified, except where either:
   (a) data is obtained over at least five sampling hours in increments of 15-minutes or less; or
   (b) at least twenty results are obtained where sampling time increments of more than 15-minutes are involved: AND in the case of (a) or (b)
   (c) no daily mean of all 15-minute mean emission concentrations should exceed the specified emission concentration limits during normal operation (excluding start-up and shut-down); and
   (d) no 15-minute mean concentration should exceed twice the specified emission concentration limits during normal operation (excluding start-up and shut-down)

SED Box 8 VOC Monitoring
(article 9)

All Activities Using
Total Emission Limit Values with abatement

For periodic measurements of VOC at least three readings must be obtained during each measurement exercise.

VOC emission limit values shall be considered to be complied with if, in one monitoring exercise:
(a) the average of all the readings does not exceed the emission limit values, and
(b) none of the hourly averages exceeds the emission limit value by more than a factor of 1.5.*

Where continuous monitoring is carried out to demonstrate compliance with VOC emission limits:
(a) none of the averages over 24 hours of normal operation exceeds the emission limit values, and
(b) none of the hourly averages exceeds the emission limit values by more than a factor of 1.5.*

*the hourly average of the 15-minute means value may be used to demonstrate compliance

5.19 Calibration and compliance monitoring for all substances should be carried out using methods below or methods which can be demonstrated to be equivalent to those stated.

- Stationary source emissions – Determination of the mass concentration of total gaseous organic carbon in flue gases from organic solvent using processes- Continuous flame ionisation detector method. EN 13526.
- Stationary source emissions – Determination of mass concentration of individual gaseous organic compounds EN 13649.
- Non-continuous emissions monitoring of particulate matter should be carried out according to the main procedural provisions of BS ISO 9096:2003, with averages taken over operating periods excluding start-up and shutdown.
- Emissions monitoring of nitrogen dioxide should be carried out in accordance with ISO 10849.
LAPPC and LAPC

- Emissions monitoring of carbon monoxide should be carried out in accordance with ISO 12039.

**Varying of monitoring frequency**

5.20 Where non-continuous quantitative monitoring is required, the frequency may be varied. Where there is consistent compliance with emission limits, regulators may consider reducing the frequency. When determining “consistent compliance” factors to consider include:

(a) the variability of monitoring results, for example, results which range from 15 – 45 mg/Nm³, against an emission limit of 50 mg/Nm³ might not qualify for a reduction in monitoring.

(b) the margin between the results and the emission limit, for example, results which range from 45 - 50 mg/Nm³ when the limit is 50 mg/Nm³ might not qualify for a reduction in monitoring.

- Consistent compliance should be demonstrated using the results from at least;
  - three or more monitoring exercises within two years; or
  - two or more monitoring exercises in one year supported by continuous monitoring

- Any significant process changes, which might have affected the monitored emission, should be taken into account.

5.21 The frequency of testing should be increased, for example, as part of the commissioning of new or substantially changed activities, or where emission levels are near to or approach the emission concentration limits.

**Monitoring of unabated releases**

5.22 Where emission limit values for VOC are consistently met without the use of abatement equipment, the monitoring requirement for those pollutants should be dispensed with subject to the “Varying of monitoring frequency” paragraphs above.

**Sampling provisions**

5.23 Care is needed in the design and location of sampling systems in order to obtain representative samples.

- The operator should ensure that adequate facilities for sampling are provided on vents or ducts.

- Sampling points on new plant should be designed to comply with the British or equivalent standards.
SED Fugitive emissions

SED Box 9 Determining Fugitive Emissions

(Annex III)

All Activities

Determining fugitive emissions using the Solvent Management Plan

To demonstrate compliance with fugitive emission values in SED Box 5 the operator must determine the fugitive emissions (F) from the installation using the following:

\[ F = I_1 - O_1 - O_5 - O_6 - O_7 - O_8 \]

Or

\[ F = O_2 + O_3 + O_4 + O_9 \]

This quantity can be determined by direct measurement of the quantities. Alternatively, an equivalent calculation can be made by other means, for instance by using the capture efficiency of the process.

The Fugitive Emission value as a percentage of the Solvent Input (I) is determined by

Fugitive Emission Value = 100 x \( F/I \)

Where the Solvent Input (I) = \( I_1 + I_2 \) (determined as part of the Solvent Management Plan)

Fugitive emission values must be determined for each installation, and must be repeated when any equipment modification is carried out.

Two or more SED activities within the same installation

SED Box 10 All Installations with Two or More Activities

(Article 5 and Annex III)

Installations with two or more activities

Installations where two or more of the activities in Annex I of the Solvents Emissions Directive are carried out, each of which exceeds the threshold in Annex IIA of the Solvents Emissions Directive must:

(1) as regards to Designated Risk Phrase Materials, meet the requirements specified in SED Box 6, for each activity individually;

(1) as regards all other substances, either:

(i) meet the requirements for each activity individually; or

(ii) have total emissions not exceeding those that would have resulted had point (i) been applied.

When applying 2 (ii) above, the Solvent Management Plan should be done to determine total emissions from all activities concerned. That figure must then be compared with the total emissions from the installation that would have resulted had the requirements of Annex II of the SED been met for each activity separately.
6 Control techniques

Summary of Best Available Techniques

6.1 The following table provides a summary of best available techniques that can be used to control the activity or installation in order to meet the emission limits and provisions in Section 5. Provided that it is demonstrated to the satisfaction of the regulator that an equivalent level of control will be achieved, then other techniques may be used.

Non VOC Releases Control Techniques

Particulate matter

6.2 Emissions of particulate matter should be abated if necessary to meet the emission limit.

- Releases of particulate matter should be controlled and filtered if necessary to meet the emission limit.
- Subject to the requirements of the clause below, the transfer of dusty solid materials should be by screw feeder, enclosed conveyors, gravity or pneumatic means.
- Where raw materials are delivered to bulk storage by tipper lorries, the raw material acceptance area should be adequately enclosed to prevent wind entrainment of dust and local exhaust ventilation should be provided to prevent the uncontrolled emission of particulate matter which should discharge through suitable arrestment plant, for example a bag filter, to minimise emissions of particulate matter.
- The delivery, handling and processing of raw materials and product can result in the releases of dusts.
- All dusty, or potentially dusty, materials should be stored in silos, sealed bags or in a purpose designed building. The silos and/or purpose designed buildings, should be fitted with arrestment plant, for example a bag filter, to meet Emission Limit Values.
- Where purpose-designed buildings are utilised, the integrity of the building should be maintained to prevent the uncontrolled escape of particulate matter. All personnel access should be through double doors and all vehicular access should be through suitable doors or strip curtains that should be closed prior to loading or off-loading.
LAPPC and LAPC

- The discharge of products into the vehicles should be carried out in such a manner to minimise the generation of airborne dust.
- Where dusty materials are removed from site in bulk vehicles, the loading area should be adequately enclosed.
- Fall heights from discharge pipes should be reduced, for example by the use of flexible hoses or socks. The areas should be fitted with where necessary with local exhaust ventilation discharging through suitable abatement plant, for example bag filters, to minimise emissions of particulate matter.
- All internal transport of dusty materials should be carried out to prevent, or where not practicable minimise, airborne dust emissions.
- Where conveyors are used, they should be enclosed and of sufficient capacity to handle maximum loads. External conveyor discharges should be arranged to minimise free fall at all times and transfer points should be fitted with exhaust ventilation discharged through abatement equipment, such as a bag filter, in order to minimise emissions of particulate matter.
- Where dusty waste materials are discharged from chutes or conveyors to storage containers or areas, the drop height should be minimised to ensure effective control of particulate matter and minimise emissions or particulate matter into the air.
- The discharge from the particulate matter abatement plant should be to screw auger, enclosed containers or enclosed conveyors. The material flow should be continuously monitored for example using optical level detectors to detect blockage abatement plant discharge points. These indicative monitors should be fitted with an audible and visual alarm to activate when blockages occur.

**Sulphur dioxide**

6.3 In combustion processes the most significant release of sulphur dioxide occurs as a result of the sulphur content of the fuel burnt and should be addressed by using low sulphur fuel as specified in Table 4.

**Nitrogen oxides**

6.4 In combustion processes nitrogen oxides can be formed as a result of the combustion of nitrogen in the fuel or the formation of thermal nitrogen oxides from nitrogen in the air used for combustion.
- Where necessary, the nitrogen content of the fuel and other material being burnt should be controlled.
- Where necessary, Low NOx burners should be installed.

**VOC Control Techniques**

**VOC and odour control storage**

6.5 Odour may arise from the receipt, handling and storage of organic solvents and organic solvent containing liquids. Careful siting of storage and mixing tanks, particularly in relation to new and replacement tanks, and controlled handling of odorous liquids may help prevent offensive emissions off-site. In addition:
- Bulk storage tanks for organic solvents and organic solvent-containing liquids should wherever practicable be back vented to the delivery tank during filling. Where this is impracticable, displaced air vents should be sited in such a way as to prevent the arising of offensive odour beyond the site boundary.
- All potentially odorous waste materials should be stored in suitable closed containers or bulk storage vessels, where appropriate vented to suitable abatement plant.
6.6 Breathing losses from bulk storage tanks can be minimised by fitting pressure vacuum relief valves. The vapour pressure within the bulk storage can also be minimised by reducing the solar absorbency of the storage tank.

- The exterior of bulk storage tanks for organic solvent storage should normally be light coloured.
- If necessary, emissions from fixed organic solvent storage tanks should be vented to suitable arrestment equipment to meet the emission limits in Section 5.
- All new static bulk organic solvent storage tanks containing organic solvent with a composite vapour pressure that is likely to exceed 0.4kPa at 20°C (293K) should be fitted with pressure vacuum relief valves. Pressure vacuum relief valves should be examined at regular intervals for signs of contamination, incorrect seating and be cleaned and/or corrected as required. The normal minimum examination frequency should be once every six months, but less frequent examination may be justified having regard for the tank contents and the potential emissions as a result of valve failure.

6.7 Both major and minor spillage of organic solvent from bulk storage tanks can arise as a result of a number of scenarios such as: overfilling of tanks, incorrect draining of filling lines, operator error or vandalism.

- Delivery connections to bulk storage tanks should be located within a bunded area.
- Where the operator cannot demonstrate to the satisfaction of the regulation that suitable management controls and training with regard to bulk storage deliveries of organic solvents and organic solvent containing materials are in place, along with adequate on-site security, then connections to bulk storage tanks should be fixed and locked when not in use.
- All fixed storage tanks should be fitted with high-level alarms or volume indicators to warn of overfilling. Where practicable the filling systems should be interlocked to the alarm system to prevent overfilling.
- Bunding should:
  - completely surround the bulk liquid storage tanks
  - be impervious and resistant to the liquids in storage; and
  - be capable of holding 110% of the capacity of the largest storage tank.

VOC control handling

6.8 The receipt, handling, use and storage of organic solvents and organic solvent containing liquids will give rise to fugitive releases of VOC.

- Raw materials containing VOC should be stored in closed storage containers.
- Emissions from the emptying of mixing vessels and transfer of materials should be adequately contained, preferably by the use of closed transfer systems. This may be achieved by the use of closed mobile containers, containers with close-fitting lids, or, preferably, closed containers with pipeline delivery.

VOC control operational

6.9 Organic solvent losses can be identified and minimised by operational controls and good operational practice.

- A programme to monitor and record the consumption of organic solvent against product produced should be used to minimise the amount of excess organic solvent used.

7. In certain circumstances, the specification of bunds may be controlled by other regulations. Conditions in permits should not conflict with the requirements of those regulations. A code of practice on the use and storage of solvents is currently being drawn up and will be published on the Defra website (www.defra.gov.uk/environment/water/ground/solvents/index) Where the code, when published, contains anything more stringent as regards bunding, account should be taken of it.
VOC control waste

6.10 Waste contaminated with VOC may give rise to both odorous and fugitive emissions.

- All reasonably practicable efforts should be made to minimise the amount of residual organic solvent bearing material left in drums and other containers after use. All organic solvent contaminated waste should be stored in closed containers.
- Prior to disposal, empty drums and containers contaminated with organic solvent should be closed to minimise emissions from residues during storage prior to disposal and labelled, so that all that handle them are aware of their contents and hazardous properties.
- Nominally empty drums or drums containing waste contaminated with VOC awaiting disposal should be stored in accordance with the requirements for full or new containers.

General Control Techniques

Dust and spillage control

6.11 Adequate provision to contain liquid and solid spillage is needed. Closed containers can prevent wind whipping of dusty, dry waste materials such as materials collected during combustion chamber cleaning or arising from particulate abatement plant:

- dusty wastes should be stored in closed containers and handled in a manner that avoids emissions
- dry sweeping of dusty materials should not normally be permitted unless there are environmental or health and safety risks in using alternative techniques
- suitable organic solvent containment and spillage equipment should be readily available in all organic solvent handling areas
- a high standard of housekeeping should be maintained.

Ambient air quality management

6.12 In areas where air quality standards or objectives are being breached or are in serious risk of breach and it is clear from the detailed review and assessment work under Local Air Quality Management that the Part B process itself is a significant contributor to the problem, it may be necessary to impose tighter emission limits. If the air quality standard that is in danger of being exceeded is not an EC Directive requirement, then industry is not expected to go beyond BAT to meet it. Decisions should be taken in the context of a local authority’s Local Air Quality Management action plan. For example, where a Part B process is only responsible to a very small extent for an air quality problem, the authority should not unduly penalise the operator of the process by requiring disproportionate emissions reductions. More guidance on this is provided in paragraph 360 of the Air Quality Strategy which gives the following advice:

“The approach from local authorities to tackling air quality should be an integrated one, involving all strands of local authority activity which impact on air quality and underpinned by a series of principles in which local authorities should aim to secure improvements in the most cost-effective manner, with regard to local environmental needs while avoiding unnecessary regulation. Their approach should seek an appropriate balance between controls on emissions from domestic, industrial and transport sources and draw on a combination and interaction of public, private and voluntary effort.”

Revised stack height calculations should not be required unless it is considered necessary because of a breach or serious risk of breach of an EC Directive limit value and because it is clear from the detailed review and assessment work that the Part B process itself is a significant contributor to the problem.
6.13 Pollutants that are emitted via a stack require sufficient dispersion and dilution in the atmosphere to ensure that they ground at concentrations that are harmless. This is the basis upon which stack heights are calculated using HMIP Technical Guidance Note D1 (D1). The emission limit in this PG note should be used as the basis for chimney height calculation. The stack height so obtained is adjusted to take into account local meteorological data, local topography, nearby emissions and the influence of plant structure. It is necessary that the assessment also take into account the relevant air quality standards that apply for the emitted pollutants.

The calculation procedure of D1 is usually used to calculate the required stack height but alternative dispersion models may be used in agreement with the regulator. D1 relies upon the unimpeded vertical emission of the pollutant. A cap or other restriction over the stack impedes the vertical emission and hinders dispersion. For this reason where dispersion is required such flow impeders should not be used. A cone may sometimes be useful to increase the efflux velocity and achieve greater dispersion.

An operator may choose to meet tighter emission limits in order to reduce the required stack height.

6.14 Liquid condensation on internal surfaces of stack flues and exhaust ducts might lead to corrosion and ductwork failure or to droplet emission.

- Adequate insulation should be provided to minimise the cooling of waste gases and prevent liquid condensation by keeping the temperature of the exhaust gases above the dewpoint.

6.15 Unacceptable emissions of droplets could possibly occur from wet abatement plant where the linear velocity within the associated ductwork exceeds 9 m/s. The use of mist eliminators reduces the potential for droplet emissions.

- Where a linear velocity of 9 m/s is exceeded in the ductwork of existing wet abatement plant, the linear velocity should be reduced, subject to health and safety considerations, to ensure that droplet fallout does not occur.

6.16 The dispersion from all stacks and vents can be impaired by low exit velocity at the point of discharge, or deflection of the discharge.

- Stacks and ductwork should be cleaned to prevent accumulation of materials, as part of the routine maintenance programme.

- A minimum discharge velocity should be required in order to prevent the discharged plume being affected by aerodynamic down wash.

- Stacks or vents should not be fitted with any restriction at the final opening such as a plate, cap or cowl, with the exception of a cone which may be necessary to increase the exit velocity of the emissions.

Management

6.17 Important elements for effective control of emissions include:

- proper management, supervision and training for process operations;
- proper use of equipment;
- effective preventative maintenance on all plant and equipment concerned with the control of emissions to the air; and
- it is good practice to ensure that spares and consumables are available at short notice in order to rectify breakdowns rapidly. This is important with respect to abatement plant and other necessary environmental controls. It is useful to have an audited list of essential items.

- Spares and consumables - in particular, those subject to continual wear - should be held on site, or should be available at short notice from guaranteed suppliers, so that plant breakdowns can be rectified rapidly.
Appropriate management systems

6.18 Effective management is central to environmental performance; it is an important component of BAT and of achieving compliance with permit conditions. It requires a commitment to establishing objectives, setting targets, measuring progress and revising the objectives according to results. This includes managing risks under normal operating conditions and in accidents and emergencies. It is therefore desirable that processes put in place some form of structured environmental management system (EMS), whether by adopting published standards (ISO 14001 or the EU Eco Management and Audit Scheme [EMAS]) or by setting up an EMS tailored to the nature and size of the particular process. Operators may also find that an EMS will help identify business savings.

Regulators should use their discretion, in consultation with individual operators, in agreeing the appropriate level of environmental management. Simple systems which ensure that LAPC considerations are taken account of in the day-to-day running of a process may well suffice, especially for small and medium-sized enterprises. While authorities may wish to encourage wider adoption of EMS, it is outside the legal scope of an LAPC authorisation/LAPPC permit to require an EMS for purposes other than LAPC/LAPPC compliance. For further information/advice on EMS refer to EMS Additional Information in Section 8.

Training

6.19 Staff at all levels need the necessary training and instruction in their duties relating to control of the process/activity and emissions to air. In order to minimise risk of emissions, particular emphasis should be given to control procedures during start-up, shut down and abnormal conditions. Training may often sensibly be addressed in the EMS referred to in paragraph above.

- Training of all staff with responsibility for operating the process/activity should include:
  - awareness of their responsibilities under the authorisation / Permit; in particular how to deal with conditions likely to give rise to VOC emissions, such as in the event of spillage
  - minimising emissions on start up and shut down
  - action to minimise emissions during abnormal conditions.
- The operator should maintain a statement of training requirements for each operational post and keep a record of the training received by each person whose actions may have an impact on the environment. These documents should be made available to the regulator on request.

6.20 Effective preventative maintenance should be employed on all aspects of the process/activity including all plant, buildings and the equipment concerned with the control of emissions to air. In particular:

- A written maintenance programme should be available to the regulator with respect to pollution control equipment; and
- A record of such maintenance should be made available for inspection by the regulator.
## 7 Summary of changes

</tr>
<tr>
<td>*Note: a preparation may contain substances which are assigned one of the risk phrases R45, R46, R49, R60 or R61, but the preparation itself would not be assigned that risk phrase, as the proportion of the risk phrase material is below the relevant classification threshold in the final preparation for the preparation as a whole to carry the risk phrase.</td>
<td></td>
</tr>
<tr>
<td>EMS</td>
<td>means Environmental Management System</td>
</tr>
</tbody>
</table>
Existing process should be taken to have the following meaning (which is based on paragraph 14 of Schedule 3 to SI 1991/472):
• a process which was being carried on at some time in the 12 months immediately preceding the first day of the month following publication of this guidance note
• a process which is to be carried on at a works, plant or factory or by means of mobile plant which was under construction or in the course of manufacture or in the course of commission on the first day of the month following publication of this guidance note, or the construction or supply of which was the subject of a contract entered into before that date

Input means the quantity of organic solvents and their quantity in preparations used when carrying out an activity, including the solvents recycled inside and outside the installation, and which are counted every time they are used to carry out the activity

Installation shall have the same meaning as in Appendix 3 of the Manual. Generally for the purposes of this note the term installation should be taken to have the same meaning as "process" for the purposes of LAPC

Installation under LAPC means process
Installation in relation to SED means the same as LAPPC except that it refers only to the parts of the installation which have an effect on emissions of VOC

LAPC explained in the Introduction section of this guidance
LAPPC explained in the Introduction section of this guidance
Local enforcing authority is replaced by the word 'regulator' in LAPPC

N means normal conditions of 273.15K, 101.3kPa

New process not an existing process

NOₓ means any oxide of nitrogen

Organic solvent means any VOC which is used alone or in combination with other agents, and without undergoing a chemical change, to dissolve raw materials, products or waste materials, or is used as a cleaning agent to dissolve contaminants, or as a dissolver, or as a dispersion medium, or as a viscosity adjuster, or as a surface tension adjuster, or a plasticiser, or as a preservative

Organic compound means any compound containing at least the element carbon and one or more of hydrogen, halogens, oxygen, sulphur, phosphorus, silicon or nitrogen, with the exception of carbon oxides and inorganic carbonates and bicarbonates

Oxidation means either thermal oxidation or catalytic oxidation

Oxidation plant means thermal or catalytic incineration plant

Permit the written permission to operate an installation prescribed for LAPPC – (the replacement for authorisation under LAPC)

Previous guidance Process Guidance Note 6/25 (97)

Process the term "process(es)" means both "processes" under the Environmental Protection Act 1990 and "installations" and "activities" under the Pollution Prevention and Control Act 1999 and the Solvent Emissions Directive 1999/13/EC

Process/activity under LAPC means process
<table>

# SED Box 11 Definitions SED Activities

(art. 2) All Activities

**Average over 24 hours**
shall mean the arithmetic average of all valid readings taken during the 24-hour period of normal operation;

**Competent Authority**
shall mean the authority or authorities or bodies responsible under the legal provisions of the Member States for carrying out the obligations arising from this Directive;

**Emission limit value**
shall mean the mass of VOCs, expressed in terms of certain specific parameters, concentration, percentage and/or level of an emission, calculated at standard conditions, which may not be exceeded during one or more periods of time;

**Emission**
shall mean any discharge of VOCs from an installation into the environment;

**Existing installation**
shall mean an installation in operation or, in accordance with legislation existing before 1 April 2001, an installation which is authorised or registered or, in the view of the regulator, the subject of a full request for authorisation, provided that the installation is put into operation no later than one year after 1 April 2001;

**Fugitive emissions**
shall mean any emissions not in waste gases of VOCs into air, soil and water as well as, unless otherwise stated in Annex II A of the Solvent Emissions Directive, solvents contained in any products. They include uncaptured emissions released to the outside environment via windows, doors, vents and similar openings;

**Halogenated organic solvent**
shall mean an organic solvent which contains at least one atom of bromine, chlorine, fluorine or iodine, per molecule;

**Installation**
shall mean a stationary technical unit where one or more activities falling within the scope defined in Article 1 of the Solvents Directive are carried out, and any other directly associated activities which have a technical connection with the activities carried out on that site and which could have an effect on emissions;

**Mass flow**
shall mean the quantity of VOCs released in unit of mass/hour;

**New installation**
shall mean an installation which is not existing;

**Nominal capacity**
shall mean the maximum mass input of organic solvents by an installation averaged over one day, if the installation is operated under conditions of normal operation at its design output;

**Normal operation**
shall mean all periods of operation of an installation or activity except start-up and shut-down operations and maintenance of equipment;

**Operator**
shall mean any natural or legal person who operates or controls the installation or, where this is provided for in national legislation, to whom decisive economic power over the technical functioning of the installation has been delegated;

**Preparation**
shall mean mixtures or solutions composed of two or more substances;

**Standard conditions**
shall mean a temperature of 273,15 K and a pressure of 101,3 kPa;
Health and safety

Operators of processes and installations must protect people at work as well as the environment:
- requirements of a permit or authorisation should not put at risk the health, safety or welfare of people at work
- equally, the permit or authorisation must not contain conditions whose only purpose is to secure the health of people at work. That is the job of the health and safety enforcing authorities

Where emission limits quoted in this guidance conflict with health and safety limits, the tighter limit should prevail because:
- emission limits under the Environmental Protection Act 1990 or Pollution Prevention and Control Act 1999 relate to the concentration of pollutant released into the air from prescribed activities
- exposure limits under health and safety legislation relate to the concentration of pollutant in the air breathed by workers
- these limits may differ since they are set according to different criteria. It will normally be quite appropriate to have different standards for the same pollutant, but in some cases they may be in conflict (for example, where air discharged from a process is breathed by workers). In such cases, the tighter limit should be applied to prevent a relaxation of control

EMS additional information

Further information/advice on EMS may be found from the following:
- Envirowise at [www.envirowise.gov.uk](http://www.envirowise.gov.uk) and [www.energy-efficiency.gov.uk](http://www.energy-efficiency.gov.uk) and Environment and Energy Helpline freephone 0800 585794
- ISO 14001 [www.bsi.org.uk](http://www.bsi.org.uk) or telephone BSI information centre (020 8966 7022)
- EU Eco Management and Audit Scheme (EMAS) [www.emas.co.uk](http://www.emas.co.uk) or telephone the Institute of Environmental Management and Assessment (01522 540069)

Regulators and process operators may also like to be aware of:

BS 8555: a new standard to help SMEs implement an EMS, by offering a five-phase approach, is contained in BS 8555 which was published in 2003 following on from work undertaken by the Acorn Trust. The Institute of Environmental Management and Assessment, which has taken over the Trust's activities, is developing a scheme of accredited recognition for companies achieving different phases of BS 8555. BS 8555 can be used to achieve ISO 14001 and registration to the higher standard, EMAS.
Some of the High Street banks, such as NatWest and the Coop, now offer preferential loan rates to organisations that can demonstrate they are committed to improving their environmental performance. The NatWest also produce a self help guide for SMEs, 'The Better Business Pack', focusing on waste, utilities, transport and supply chain issues. It gives tools, guidance and examples. Appendix 1: Extract from LAPPC Regulations

See also Section 7 of Schedule 1 to the PPC Regulations as inserted by the Solvent Emissions (England and Wales) Regulations 2004, SI 107.*

Part A(1)

(a) Tanning hides and skins at plant with a treatment capacity of more than 12 tonnes of finished products per day.

(b) Slaughtering animals at plant with a carcass production capacity of more than 50 tonnes per day.

(c) Disposing of or recycling animal carcasses or animal waste, other than by rendering, at plant with a treatment capacity exceeding 10 tonnes per day of animal carcasses or animal waste or, in aggregate, of both.

(d) Treating and processing materials intended for the production of food products from

(i) animal raw materials (other than milk) at plant with a finished product production capacity of more than 75 tonnes per day;

(ii) vegetable raw materials at plant with a finished product production capacity of more than 300 tonnes per day (average value on a quarterly basis).

(e) Treating and processing milk, the quantity of milk received being more than 200 tonnes per day (average value on an annual basis).

(f) Processing, storing or drying by the application of heat of the whole or part of any dead animal or any vegetable matter (other than the treatment of effluent so as to permit its discharge into controlled waters or into a sewer unless the treatment involves the drying of any material with a view to its use as animal feedstuff) if

(i) the processing, storing or drying does not fall within another Section of this Schedule or Part A(2) of this Section and is not an exempt activity; and

(ii) it may result in the release into water of any substance listed in paragraph 13 of Part 2 of this Schedule in a quantity which, in any period of 12 months, is greater than the background quantity by more than the amount specked in relation to the substance in that paragraph.

Part A(2)

(a) Disposing of or recycling animal carcasses or animal waste by rendering at plant with a treatment capacity exceeding 10 tonnes per day of animal carcasses or animal waste, or, in aggregate, of both.

Part B
(a) Processing, storing or drying by the application of heat of the whole or part of any dead animal or any vegetable matter (other than the treatment of effluent so as to permit its discharge into controlled waters or into a sewer unless the treatment involves the drying of any material with a view to its use as animal feedstuff) if

(i) the processing, storing or drying does not fall within another Section of this Schedule or Part A(1) or Part A(2) of this Section and is not an exempt activity; and

(ii) the processing, storing or drying may result in the release into the air of a substance described in paragraph 12 of Part 2 of this Schedule or any offensive smell noticeable outside the premises on which the activity is carried out.

(b) Breeding maggots in any case where 5 kg or more of animal matter or of vegetable matter or, in aggregate, of both are introduced into the process in any week.

Interpretation of Section 6.8

In this Section
"animal" includes a bird or a fish;
"exempt activity" means

(i) any activity carried out in a farm or agricultural holding other than the manufacture of goods for sale;

(ii) the manufacture or preparation of food or drink for human consumption but excluding

(1) the extraction, distillation or purification of animal or vegetable oil or fat otherwise than as an activity incidental to the cooking of food for human consumption;

(2) any activity involving the use of green offal or the boiling of blood except the cooking of food (other than tripe) for human consumption;

(3) the cooking of tripe for human consumption elsewhere than on premises on which it is to be consumed;

(iii) the fleshing, cleaning and drying of pelts of fur bearing mammals;

(iv) any activity carried on in connection with the operation of a knacker's yard, as defined in article 3(1) of the Animal By Products Order 1999;

(v) any activity for the manufacture of soap not falling within Part A(1) of [Section 4.1];

(vi) the storage of vegetable matter not falling within any other Section of this Schedule;

(vii) the cleaning of shellfish shells;
(viii) the manufacture of starch;

(ix) the processing of animal or vegetable matter at premises for feeding a recognised pack of hounds registered under article 13 of the Animal By Products Order 1999;

(x) the salting of hides or skins, unless related to any other activity listed in this Schedule;

(xi) any activity for composting animal or vegetable matter or a combination of both, except where that activity is carried on for the purposes of cultivating mushrooms;

(xii) any activity for cleaning, and any related activity for drying or dressing, seeds, bulbs, corms or tubers;

(xiii) the drying of grain or pulses;

(xiv) any activity for the production of cotton yarn from raw cotton or for the conversion of cotton yam into cloth;

"food" includes

(i) drink;

(ii) articles and substances of no nutritional value which are used for human consumption; and

(iii) articles and substances used as ingredients in the preparation of food;

"green offal" means the stomach and intestines of any animal, other than poultry or fish, and their contents.

*Every effort has been taken to ensure that this Appendix is correct at the date of publication, but readers should note that the Regulations are likely to be subject to periodic amendment, and this Appendix should not therefore be relied upon as representing the up-to-date position after the publication date.
Appendix 2: Extract from Solvent Emissions Directive (SED)

Extracts from the Solvent Emissions Directive 1999/13/EC

Article 1- Purpose and scope

The purpose of this Directive is to prevent or reduce the direct and indirect effects of emissions of VOCs into the environment, mainly into air, and the potential risks to human health, by providing measures and procedures to be implemented for the activities defined in Annex I, in so far as they are operated above the solvent consumption thresholds listed in Annex II A.

Article 4 - Obligations applying to existing installations

Without prejudice to Directive 96/61/EC, Member States shall adopt the necessary measures to ensure that:

1. existing installations comply with Articles 5, 8 and 9 no later than 31 October 2007;

2. all existing installations must have been registered or authorised by 31 October 2007 at the latest;

3. those installations to be authorised or registered using the reduction scheme of Annex II B notify this to the competent authorities by 31 October 2005 at the latest;

4. where an installation:

- undergoes a substantial change, or
- comes within the scope of this Directive for the first time following a substantial change,

that part of the installation which undergoes the substantial change shall be treated either as a new installation or as an existing installation, provided that the total emissions of the whole installation do not exceed those that would have resulted had the substantially changed part been treated as a new installation.

Article 5 - Requirements

2. All installations shall comply with:

a) either the emission limit values in waste gases and the fugitive emission values, or the total emission limit values, and other requirements laid down in Annex II A;

Or

b) the requirements of the reduction scheme specified in Annex II B

3. (a) For fugitive emissions, Member States shall apply fugitive emission values to installations as an emission limit value. However, where it is demonstrated to the satisfaction of the competent authority that for an individual installation this value is not technically and economically feasible, the competent authority can make an exception for such an individual installation provided that significant risks to human health or the environment are not to be expected. For each derogation, the operator must demonstrate to the satisfaction of the competent authority that the best available technique is being used;

(b) Activities which cannot be operated under contained conditions may be exempted from the controls of Annex II A, when this possibility is explicitly mentioned in that Annex. The reduction scheme of Annex II B is then to be used, unless it is demonstrated to the satisfaction of the competent authority that this option is not technically and economically feasible. In this case, the operator must demonstrate to the satisfaction of the competent authority that the best available technique is being used.

Member States shall report to the Commission on the derogation concerning paragraphs (a) and (b) in accordance with Article 11.
4. For installations not using the reduction scheme, any abatement equipment installed after
the date on which this Directive is brought into effect shall meet all the requirements of Annex
IIA.

5. Installations where two or more activities are carried out, each of which exceeds the
thresholds in Annex IIA shall:
(a) as regards the substances specified in paragraphs 6, 7 and 8, meet the requirements of
those paragraphs for each activity individually;
(b) as regards all other substances, either:
   (i) meet the requirements of paragraph 2 for each activity individually; or
   (ii) have total emissions not exceeding those that would have resulted had point (i) been
        applied

6. Substances or preparations which, because of their content of VOCs classified as
carcinogens, mutagens, or toxic to reproduction under Directive 67/548/EEC (1), are assigned
or need to carry the risk phrases R45, R46, R49, R60, R61, shall be replaced, as far as
possible and by taking into account the guidance as mentioned in Article 7(1), by less harmful
substances or preparations within the shortest possible time.

7. For discharges of the VOCs referred to in paragraph 6, where the mass flow of the sum of
the compounds causing the labelling referred to in that paragraph is greater than, or equal to,
10 g/h, an emission limit value of 2 mg/Nm$^3$ shall be complied with. The emission limit value
refers to the mass sum of the individual compounds.

8. For discharges of halogenated VOCs which are assigned the risk phrase R40, where the
mass flow of the sum of the compounds causing the labelling R40 is greater than, or equal to,
100 g/h, an emission limit value of 20 mg/Nm$^3$ shall be complied with. The emission limit value
refers to the mass sum of the individual compounds.

The discharge of VOCs referred to in paragraphs 6 and 8 shall be controlled as emissions
from an installation under contained conditions as far as technically and economically feasible
to safeguard public health and the environment.

9. Discharges of those VOCs which, after the entry into force of this Directive, are assigned or
need to carry one of the risk phrases mentioned in paragraphs 6 and 8, shall have to comply
with the emission limit values mentioned in paragraphs 7 and 8 respectively, within the
shortest possible time.

10. All appropriate precautions shall be taken to minimise emissions during start-up and
shut-down.

11. Existing installations which operate existing abatement equipment and comply with the
following emission limit values:
   • 50 mg C/Nm$^3$ in the case of incineration,
   • 150 mg C/Nm$^3$ in the case of any other abatement equipment,

shall be exempt from the waste gases emission limit values in the table in Annex IIA for a
period of 12 years after the date referred to in Article 15, provided the total emissions of the
whole installation do not exceed those that would have resulted had all the requirements of
the table been met.

12. Neither the reduction scheme nor the application of paragraph 11 nor Article 6 exempt
installations discharging substances specified in paragraphs 6, 7 and 8 from fulfilling the
requirements of those paragraphs.
Article 7 - Substitution

1. The commission shall ensure that an exchange of information between Member States and the activities concerned on the use of organic substances and their potential substitutes takes place. It shall consider the question of:
   • fitness for use,
   • potential effects on human health and occupational exposure in particular;
   • potential effects on the environment, and
   • the economic consequences, in particular, the cost and benefits of the options available, with a view to providing guidance on the use of substances and techniques which have the least potential effects on air, water, soil, ecosystems and human health.

Article 8 - Monitoring

3. In the other cases, Member States shall ensure that either continuous or periodic measurements are carried out. For periodic measurements at least three readings shall be obtained during each measurement exercise.

Article 9 - Compliance with emission limit values

1. Compliance with the following shall be demonstrated to the satisfaction of the competent authority:
   • emission limit values in waste gases, fugitive emission values and total emission limit values,
   • the requirements of the reduction scheme under Annex IIIB,
   • the provisions of Article 5 (3)

Guidance is provided in Annex III on solvent management plans serving to demonstrate compliance with these parameters.

Gas volumes may be added to the waste gas for cooling or dilution purposes where technically justified but shall not be considered when determining the mass concentration of the pollutant in the waste gas.

2. Following a substantial change, compliance shall be reverified.

3. In the case of continuous measurements the emission limit values shall be considered to-be complied with if:
   (a) none of the averages over 24 hours of normal operation exceeds the emission limit values, and
   (b) none of the hourly averages exceeds the emission limit values by more than a factor of 1.5.

4. In the case of periodic measurements the emission limit values shall be considered to be complied with if, in one monitoring exercise:
   (a) the average of all the readings does not exceed the emission limit values, and
   (b) none of the hourly averages exceeds the emission limit value by more than a factor of 1.5.

5. Compliance with the provisions of Article 5(7) and (8) shall be verified on the basis of the sum of the mass concentrations of the individual VOCs concerned. For all other cases, compliance shall be verified on the basis of the total mass of organic carbon emitted unless otherwise specified in Annex IIA.
Article 10 - Non-compliance

Member States shall take appropriate measures to ensure that, if it is found that the requirements of this Directive have been breached:
(a) the operator informs the competent authority and takes measures to ensure that compliance is restored within the shortest possible time;
(b) in cases of non-compliance causing immediate danger to human health and as long as compliance is not restored under the conditions of paragraph (a), operation of the activity is suspended.
SED - ANNEX I

Scope

This Annex contains the categories of activity referred to in Article 1. When operated above the thresholds listed in Annex II A, the activities mentioned in this Annex fall within the scope of the Directive. In each case the activity includes the cleaning of the equipment but not the cleaning of products unless specified otherwise.

Adhesive coating
• Any activity in which an adhesive is applied to a surface, with the exception of adhesive coating and laminating associated with printing activities.

Coating activity
• Any activity in which a single or multiple application of a continuous film of a coating is applied to:
  • Vehicles as listed below:
    – new cars, defined as vehicles of category M1 in Directive 70/156/EEC, and of category N1 in so far as they are coated at the same installation as M1 vehicles,
    – truck cabins, defined as the housing for the driver, and all integrated housing for the technical equipment, of vehicles of categories N2 and N3 in Directive 70/156/EEC,
    – vans and trucks, defined as vehicles of categories N1, N2 and N3 in Directive 70/156/EEC, but not including truck cabins,
    – buses, defined as vehicles of categories M2 and M3 in Directive 70/156/EEC,
  • trailers, defined in categories O1, O2, O3 and O4 in Directive 70/156/EEC,
  • metallic and plastic surfaces including surfaces of airplanes, ships, trains, etc.,
  • wooden surfaces,
  • textile, fabric, film and paper surfaces,
  • leather.

It does not include the coating of substrate with metals by electrophoretic and chemical spraying techniques. If the coating activity includes a step in which the same article is printed by whatever technique used, that printing step is considered part of the coating activity. However, printing activities operated as a separate activity are not included, but may be covered by the Directive if the printing activity falls within the scope thereof.

Coil coating
• Any activity where coiled steel, stainless steel, coated steel, copper alloys or aluminium strip is coated with either a film forming or laminate coating in a continuous process.

Dry cleaning
• Any industrial or commercial activity using VOCs in an installation to clean garments, furnishing and similar consumer goods with the exception of the manual removal of stains and spots in the textile and clothing industry.

Footwear manufacture
• Any activity of producing complete footwear or parts thereof.

Manufacturing of coating preparations, varnishes, inks and adhesives
• The manufacture of the above final products, and of intermediates where carried out at the same site, by mixing of pigments, resins and adhesive materials with organic solvent or other carrier, including dispersion and predispersion activities, viscosity and tint adjustments and operations for filling the final product into its container.

Manufacturing of pharmaceutical products
• The chemical synthesis, fermentation, extraction, formulation and finishing of pharmaceutical products and where carried out at the same site, the manufacture of intermediate products.
Printing

- Any reproduction activity of text and/or images in which, with the use of an image carrier, ink is transferred onto whatever type of surface. It includes associated varnishing, coating and laminating techniques. However, only the following sub-processes are subject to the Directive:

- Flexography - a printing activity using an image carrier of rubber or elastic photopolymers on which the printing areas are above the non-printing areas, using liquid inks which dry through evaporation,

- Heatset web offset - a web-fed printing activity using an image carrier in which the printing and non-printing area are in the same plane, where web-fed means that the material to be printed is fed to the machine from a reel as distinct from separate sheets. The non-printing area is treated to attract water and thus reject ink. The printing area is treated to receive and transmit ink to the surface to be printed. Evaporation takes place in an oven where hot air is used to heat the printed material,

- Laminating associated to a printing activity - the adhering together of two or more flexible materials to produce laminates,

- Publication rotogravure - a rotogravure printing activity used for printing paper for magazines, brochures, catalogues or similar products, using toluene-based inks,

- Rotogravure - a printing activity using a cylindrical image carrier in which the printing area is below the non-printing area, using liquid inks which dry through evaporation. The recesses are filled with ink and the surplus is cleaned off the non-printing area before the surface to be printed contacts the cylinder and lifts the ink from the recesses,

- Rotary screen printing - a web-fed printing activity in which the ink is passed onto the surface to be printed by forcing it through a porous image carrier, in which the printing area is open and the non printing area is sealed off, using liquid inks which dry only through evaporation. Web-fed means that the material to be printed is fed to the machine from a reel as distinct from separate sheets,

- Varnishing - an activity by which a varnish or an adhesive coating for the purpose of later sealing the packaging material is applied to a flexible material.

Rubber conversion

- Any activity of mixing, milling, blending, calendering, extrusion and vulcanisation of natural or synthetic rubber and any ancillary operations for converting natural or synthetic rubber into a finished product.

Surface cleaning

- Any activity except dry cleaning using organic solvents to remove contamination from the surface of material including degreasing. A cleaning activity consisting of more than one step before or after any other activity shall be considered as one surface cleaning activity. This activity does not refer to the cleaning of the equipment but to the cleaning of the surface of products.

Vegetable oil and animal fat extraction and vegetable oil refining activities

- Any activity to extract vegetable oil from seeds and other vegetable matter, the processing of dry residues to produce animal feed, the purification of fats and vegetable oils derived from seeds, vegetable matter and/or animal matter.

Vehicle refinishing

- Any industrial or commercial coating activity and associated degreasing activities performing:

  - The coating of road vehicles as defined in Directive 70/156/EEC, or part of them, carried out as part of vehicle repair, conservation or decoration outside of manufacturing installations, or

  - The original coating of road vehicles as defined in Directive 70/156/EEC or part of them with refinishing-type materials, where this is carried out away from the original manufacturing line, or

  - The coating of trailers (including semi-trailers) (category O).
Winding wire coating
• Any coating activity of metallic conductors used for winding the coils in transformers and motors, etc.

Wood impregnation
• Any activity giving a loading of preservative in timber.

Wood and plastic lamination
• Any activity to adhere together wood and/or plastic to produce laminated products.

(1) | (2)
II. THE VEHICLE COATING INDUSTRY

The total emission limit values are expressed in terms of grams of solvent emitted in relation to the surface area of product in square metres and in kilograms of solvent emitted in relation to the car body.

The surface area of any product dealt with in the table below is defined as follows:

- the surface area calculated from the total electrophoretic coating area, and the surface area of any parts that might be added in successive phases of the coating process which are coated with the same coatings as those used for the product in question, or the total surface area of the product coated in the installation.

The surface of the electrophoretic coating area is calculated using the formula:

\[
\frac{2 \times \text{total weight of product shell}}{\text{average thickness of metal sheet} \times \text{density of metal sheet}}
\]

This method shall also be applied for other coated parts made out of sheets.

Computer aided design or other equivalent methods shall be used to calculate the surface area of the other parts added, or the total surface area coated in the installation.

The total emission limit value in the table below refers to all process stages carried out at the same installation from electrophoretic coating, or any other kind of coating process, through to the final wax and polish of topcoating inclusive, as well as solvent used in cleaning of process equipment, including spray booths and other fixed equipment, both during and outside of production time. The total emission limit value is expressed as the mass sum of organic compounds per m² of the total surface area of coated product and as the mass sum of organic compounds per car body.

Vehicle coating installations below the solvent consumption thresholds in the table above shall meet the requirements for the vehicle refinishing sector in Annex IIA.
SED - ANNEX IIB

REDUCTION SCHEME

1. Principles

The purpose of the reduction scheme is to allow the operator the possibility to achieve by other means emission reductions, equivalent to those achieved if the emission limit values were to be applied. To that end the operator may use any reduction scheme, specially designed for his installation, provided that in the end an equivalent emission reduction is achieved. Member States shall report according to Article 11 of the Directive to the Commission about the progress in achieving the same emission reduction, including the experience from the application of the reduction scheme.

2. Practice

in the case of applying coatings, varnishes, adhesives or inks, the following scheme can be used. Where the following method is inappropriate the competent authority may allow an operator to apply any alternative exemption scheme which it is satisfied fulfils the principles outlined here. The design of the scheme takes into account the following facts:
(i) where substitutes containing little or no solvent are still under development, a time extension must be given to the operator to implement his emission reduction plans;
(ii) the reference point for emission reductions should correspond as closely as possible to the emissions which would have resulted had no reduction action been taken.

The following scheme shall operate for installations for which a constant solid content of product can be assumed and used to define the reference point for emission reductions:
(i) the operator shall forward an emission reduction plan which includes in particular decreases in the average solvent content of the total input and/or increased efficiency in the use of solids to achieve a reduction of the total emissions from the installation to a given percentage of the annual reference emissions, termed the target emission. This must be done on the following time frame:

<table>
<thead>
<tr>
<th>Time Period</th>
<th>Maximum allowed total annual emissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>New installations</td>
<td>Existing installations</td>
</tr>
<tr>
<td>By 31.10.2001</td>
<td>By 31.10.2005</td>
</tr>
<tr>
<td>By 31.10.2004</td>
<td>By 31.10.2007</td>
</tr>
<tr>
<td></td>
<td>Target emission x 1.5</td>
</tr>
<tr>
<td></td>
<td>Target emission</td>
</tr>
</tbody>
</table>

(ii) The annual reference emission is calculated as follows:
(a) The total mass of solids in the quantity of coating and/or ink, varnish or adhesive consumed in a year is determined. Solids are all materials in coatings, inks, varnishes and adhesives that become solid once the water or the VOCs are evaporated.
(b) The annual reference emissions are calculated by multiplying the mass determined in (a) by the appropriate factor listed in the table below. Competent authorities may adjust these factors for individual installations to reflect documented increased efficiency in the use of solids.
(c) The target emission is equal to the annual reference emission multiplied by a percentage equal to:

- (the fugitive emission value + 15), for installations falling within item 6 and the lower threshold band of items 8 and 10 of Annex IIA,
- (the fugitive emission value + 5) for all other installations.

(d) Compliance is achieved if the actual solvent emission determined from the solvent management plan is less than or equal to the target emission.

SED - ANNEX III

SOLVENT MANAGEMENT PLAN

1. Introduction

This Annex provides guidance on carrying out a solvent management plan. It identifies the principles to be applied (item 2) and provides a framework for the mass balance (item 3) and an indication of the requirements for verification of compliance (item 4).

2. Principles

The solvent management plan serves the following purposes:
(i) verification of compliance as specified in Article 9(1);
(ii) identification of future reduction options;
(iii) enabling of the provision of information on solvent consumption, solvent emissions and compliance with the Directive to the public.

3. Definitions

The following definitions provide a framework for the mass balance exercise.

Inputs of organic solvents (I):

$I_1$ The quantity of organic solvents or their quantity in preparations purchased which are used as input into the process in the time frame over which the mass balance is being calculated.

$I_2$ The quantity of organic solvents or their quantity in preparations recovered and reused as solvent input into the process. (The recycled solvent is counted every time it is used to carry out the activity.)

Outputs of organic solvents (O):

$O_1$ Emissions in waste gases.

$O_2$ Organic solvents lost in water, if appropriate taking into account waste water treatment when calculating $O_5$.

$O_3$ The quantity of organic solvents which remains as contamination or residue in products output from the process.

$O_4$ Uncaptured emissions of organic solvents to air. This includes the general ventilation of rooms, where air is released to the outside environment via windows, doors, vents and similar openings.

$O_5$ Organic solvents and/or organic compounds lost due to chemical or physical reactions. (including for example those which are destroyed, e.g. by thermal oxidation or other waste gas or waste water treatments, or captured, e.g. by adsorption, as long as they are not counted under $O_6$, $O_7$, or $O_9$).

$O_6$ Organic solvents contained in collected waste.

$O_7$ Organic solvents, or organic solvents contained in preparations, which are sold or are intended to be sold as a commercially valuable product.

$O_8$ Organic solvents contained in preparations 'recovered for reuse but not as input into the process, as long as not counted under $O_7$.

$O_9$ Organic solvents released in other ways.
4. Guidance on use of the solvent management plan for verification of compliance

The use made of the solvent management plan will be determined by the particular requirement which is to be verified, as follows:

(i) Verification of compliance with the reduction option in Annex II B, with a total emission limit value expressed in solvent emissions per unit product, or otherwise stated in Annex II A.

(a) For all activities using Annex II B the solvent management plan should be done annually to determine consumption \( (C) \). Consumption can be calculated according to the following equation:

\[
C = I_1 - O_8
\]

A parallel exercise should also be undertaken to determine solids used in coating in order to derive the annual reference emission and the target emission each year.

(b) For assessing compliance with a total emission limit value expressed in solvent emissions per unit product or otherwise stated in Annex II A, the solvent management plan should be done annually to determine emissions \( (E) \). Emissions can be calculated according to the following equation:

\[
E = F + O_1
\]

where \( F \) is the fugitive emission as defined in section (ii)(a). The emission figure should then be divided by the relevant product parameter.

(c) For assessing compliance with the requirements of Article 5(5)(b)(ii), the solvent management plan should be done annually to determine total emissions from all activities concerned, and that figure should then be compared with the total emissions that would have resulted had the requirements of Annex II been met for each activity separately.

(ii) Determination of fugitive emissions for comparison with fugitive emission values in Annex II A:

(a) Methodology

The fugitive emission can be calculated according to the following equation:

\[
F = I_1 - O_1 - O_5 - O_6 - O_7 - O_8
\]

or

\[
F = O_2 + O_3 + O_4 + O_9
\]

This quantity can be determined by direct measurement of the quantities. Alternatively, an equivalent calculation can be made by other means, for instance by using the capture efficiency of the process.

The fugitive emission value is expressed as a proportion of the input, which can be calculated according to the following equation:

\[
I = I_1 + I_2
\]

(b) Frequency

Determination of fugitive emissions can be done by a short but comprehensive set of measurements. It need not be done again until the equipment is modified.
