HMRC TAX & NIC RECEIPTS

Monthly and annual historical record

Coverage:
United Kingdom

Theme:
The Economy

Released:
22nd August 2017

Next Release:
21st September 2017

Frequency of release:
Published monthly on the 15th working day except if it falls on a Monday, in which case publication would be on the 16th working day

Introduction

This bulletin only presents information on the taxes collected by HMRC. For complete coverage of all central government tax receipts (including business rates, Vehicle Excise Duty and Television licence) please refer to the Public Sector Finances publication from the Office for National Statistics. For complete coverage of all UK tax receipts, including those from local government, please refer to the Blue Book publication from the Office for National Statistics.

HMRC tax receipts

HMRC collected £569.3 billion in taxes in 2016-17. The table below shows the total percentage contribution of each tax towards the total HMRC receipts per financial year.

1 See for example Table PSA6D, http://www.ons.gov.uk/ons/government/publications/public-sector-finances-bulletin
2 See for example Table 11.1, http://www.ons.gov.uk/ons/rel/naa1/naa1-ctd/united-kingdom-national-accounts/index.html
Over the last decade IT, CGT & NICs (Income tax, Capital Gains Tax and National Insurance Contributions) combined made up on average 56 per cent of total receipts. Value Added Tax (VAT) and Corporation Tax, Bank Levy and Petroleum Revenue Tax (CT, BL and PRT) are the next biggest, contributing an average 20 per cent and 9 per cent of total receipts respectively.

Figure 1 shows annual revenue for total HMRC Receipts, and revenue as a percentage of GDP since 1980-81. In cash terms, HMRC receipts have grown fairly steadily over the period, but as a percentage of GDP there has been quite a degree of variation. From 1984-85 to 1993-94 the proportion fell from around 30.5% of GDP to around 25.5% of GDP. This was initially due to the economy growing faster than tax receipts and then a drop off in receipts after the economic slowdown of the early 1990s. There was then a rebound to 2000-01 as the proportion rose back to around 29.0%. Since then they have mostly followed the economic cycle, though the recent upturn has been slower than previous recoveries.

Figure 1  Total HMRC Receipts, 1980-2016
Figure 2 shows a comparison between taxes since 1980-81 on:

- **Consumption & environmental** (including VAT, Fuel, Tobacco, Alcohol, Betting & Gaming, Air Passenger Duty, Insurance Premium Tax, Landfill Tax, Climate Change & Aggregates Levy)
- **Personal income** (Income Tax, National Insurance Contributions & Bank Payroll Tax)
- **Business income and wealth** (Corporation Tax, Bank Levy & Petroleum Revenue Tax)
- **Capital & other receipts** (Capital Gains Tax, Inheritance Tax, Stamp Taxes, Swiss Capital Tax, Customs duties and older taxes now abolished).

**Figure 2**  
Total HMRC Receipts, by category, 1980-2017
Methodology and Data Quality

Methodology

HMRC accounting systems and accounts form the basis of these statistics. For some revenue streams adjustments are made to the figures to ensure the definitions align with EuroStat requirements. Adjustments are made to the following taxes:

National Insurance Contributions - adjustments are made to the accounts for amounts paid out in pension contributions and statutory sick/maternity/paternity pay recoveries.

For all other taxes the definitions used in the accounts align with EuroStat requirements so no adjustments are necessary.

Data quality

The HMRC accounts, which are audited by the National Audit Office (NAO), form the basis of the annual statistics.

The HMRC accounts are published on an accruals basis and differ from these statistics, which are on a cash basis. Following publication of the accounts, our statistics are reviewed against the audited annual accounts and adjustments are made to bring them in line with the cash based account. This publication includes such revisions for 2016-17.

Quality Assurance

We are committed to continuously improving the official statistics we publish. Our quality assurance processes have recently been reviewed (June 2017). As a result further safeguards including systematic automated checks to minimise the risk of error and the use of a quality assurance review checklist in the production of the statistics have been set in place. These measures will enhance the level of assurance and provide a clear audit trail.

As mentioned in the section above, HMRC accounts form the basis of these statistics but as part of quality assurance process to highlight any revisions since the previous month’s publication, checks are made against the data reported to HM Treasury and the Office of National Statistics. Further to this, each section is scrutinised by analytical staff working on each tax/ tax credits area. The publication is also peer reviewed by different team members and overseen by the team’s senior statistician.

Payovers to the consolidated fund compared with total receipts

The consolidated fund is essentially a general bank account for the Government. The total paid over to the consolidated fund is the value received by HMRC.

Total receipts are the amount recorded on HMRC accounting systems.

The two figures are different due to varying methods of payment and the speed at which HMRC systems are updated. Total HMRC Receipts includes all payments into the Consolidated Fund and all payovers of NICs including those of Northern Ireland.
This dataset forms the basis of both the cash and accrued receipts in the public sector finances - [https://www.gov.uk/government/publications/public-sector-finances-bulletin](https://www.gov.uk/government/publications/public-sector-finances-bulletin)

**Footnotes:**
- **Figures remain as provisional until they are aligned to the HMRC Annual Report and Trust Statement, which is published following the end of each financial year.
- **Comprises of payments into the Consolidated Fund and all payovers of NICs excluding those of Northern Ireland.
- **Figures in italic are included with the relevant total for either income tax or corporation tax.
- **From April 2011, the Child Benefit series has been revised to ensure consistency with HMRC Resource Accounts.
- **From April 2013, includes receipts from Carbon Price Floor.
- **The duty on spirits includes alcoholic and non-alcoholic.
- **Amounts: £ million

There is a longer Excel version of this table also available on our website featuring monthly data starting back to April 2008. Historical annual data goes back to 1999-00.
Commentary on Receipts

The following pages include commentary for the main taxes on the total receipts over the last five years and as a proportion of nominal GDP and also the year to date receipts compared against the same period last year. GDP for 2016-17 is the most recent forecast from the Office for Budget Responsibility (OBR).

Useful Links

Details of how much National Insurance Contributions are paid by employers and employees can be found here: http://budgetresponsibility.org.uk/download/march-2017-economic-and-fiscal-outlook-supplementary-fiscal-tables-receipts-and-other/

Statistics and analysis of HMRC receipts disaggregated between England, Wales, Scotland and Northern Ireland can be found at https://www.gov.uk/government/statistics/disaggregation-of-hmrc-tax-receipts

Our publications have moved to the GOV.UK site where you can also find publications by other Government bodies. https://www.gov.uk/

If you wish to see more statistics on your area of interest there are also links at the bottom of each page which will take you to that area on our website. Our publications are mainly used for media commentary, policy development and research. A recent survey was completed on our publications, which can be accessed via the link below. https://www.gov.uk/government/publications/hmrc-tax-nics-receipts-survey-results

Archived tables can be found here: https://www.gov.uk/government/collections/hm-revenue-customs-receipts
Income Tax, Capital Gains Tax & National Insurance Contributions, & Apprenticeship Levy

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Receipts in 2016-17 have continued to increase following the economic slowdown in 2009-10. In 2016-17 receipts as a proportion of the OBR’s forecast GDP level were 16.0 per cent compared to 16.7 per cent in 2008-09; this fall can be mostly attributed to the reduction in economic activity and some structural changes such as above-inflation increases in the personal allowance. Revenues in 2010-11 also include Bank Payroll Tax receipts.

Figure 3  Income Tax, Capital Gains Tax & National Insurance Contributions 1980-2017

Monthly receipts in the current and 4 previous years are shown below. The peaks in July and January reflect the bi-annual due dates for self-assessment (SA) (31st Jan, 31st Jul). January to April typically also capture PAYE bonus-related receipts, particularly from the financial sector. Receipts for April to July 2017 are 3.7 per cent higher when compared to the same period last year.

Figure 4  Income Tax, Capital Gains Tax & National Insurance Contributions, & Apprenticeship Levy

For more statistics about income tax receipts and liabilities (on an annual basis) click here to go to the income tax and personal incomes section of our website.
Value added tax (VAT)

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Receipts are now at a peak of £119.8 billion up from £70.2bn in 2009-10. The fall in 2009-10 and then the subsequent upturn can be explained by the reduction in the standard rate of VAT to 15 per cent in December 2008 then increasing to 17.5 per cent in January 2010, and to 20 per cent in January 2011. Receipts as a percentage of nominal GDP increased from 4.6 per cent in 2009-10 to 6.0 per cent in 2011-12 reflecting changes in the VAT rate. In 2016-17, VAT receipts were equivalent to 6.2 per cent of the OBR’s forecast GDP level.

**Figure 5**  
*Value Added Tax receipts, 1980-2017*

Monthly receipts in the current and 4 previous years are shown below. Most VAT receipts are paid quarterly hence the large figures in particular months. Many traders opt to pay in April, July, October and January (stagger 1) as it corresponds with the end of the financial and calendar year. Receipts for April to July 2017 are 5.7 per cent higher than in the same period last year.

**Figure 6**  
*Value Added Tax receipts*

For more information on VAT receipts, click here to go to the business taxes section of our website.
Corporation Tax, Bank Surcharge, Bank Levy, Petroleum Revenue & Diverted Profits Tax

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. CT receipts as a proportion of GDP have declined since the mid-1980s. The dips in 1990-91, 2000-01 and 2009-10 each reflect declining profits in economic slowdowns. For 2014-15, 2015-16 and 2016-17, growth in the home, industrial and commercial sector and the financial sector outweighed lower oil and gas receipts. Oil & gas revenues in 2015-16 and 2016-17 were low mainly due to low oil prices combined with high operating costs, significant levels of investment and increasing amounts of decommissioning expenditure. The reduction in tax rates from January 2016 for PRT and SC (from 50 per cent to zero per cent and 32 per cent to 10 per cent respectively) also contributed to the decrease in oil & gas revenues. Reductions in the main rate of CT have also affected receipts; the rate fell from 26 per cent in 2011-12 to 20 per cent for 2015-16 and 2016-17. Receipts increased between 2015-16 and 2016-17 due in particular to growth in companies’ profits and the introduction of the Bank Surcharge.

Figure 7 Corporation Tax receipts, 1980-2017

The chart of monthly receipts (below) shows the peak months (Apr, Jul, Oct, Jan) are when the majority of large companies with calendar year and financial year accounting periods make their quarterly instalment payments. Small companies must pay their liabilities nine months and one day after the end of their accounting period. Receipts for April to July 2017 are 16.9 per cent higher than in the same period last year mainly due to Corporation tax.

Figure 8 Corporation Tax, Bank Surcharge, Bank Levy, Petroleum Revenue & Diverted Profits Tax receipts

For more information, click here to go find the corporate tax section on our website.

---

3 From 2011-12 the figures include Bank Levy receipts, and from 1 January 2016 include bank surcharge. As of March 2017, receipts for Diverted Profits Tax (DPT) are included within CT and although these are different taxes, they have been combined as showing DPT separately could result in disclosing taxpayer information.

4 The 2015-16 and 2016-17 oil and gas figures are provisional and subject to change in the future when payments originally made in respect of a group of companies are subsequently re-allocated to individual companies within the group but which are outside of the ring fence oil and gas regime.
The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Receipts have grown over time, mainly in line with the performance of the housing market. After relatively stable receipts between 2009-10 and 2012-13 there was a 36.5 per cent increase in 2013-14 and a further 10.4 per cent increase in 2014-15, mainly due to increased number of transactions, higher property prices and increase in the tax rates for residential properties priced above £925,000 introduced in December 2014. In 2015-16 receipts increased more slowly followed by a sharper increase in 2016-17. This is likely to be partially due to major policy changes to the marginal rates and thresholds for residential Stamp Duty Land Tax (SDLT) in December 2014 and devolution of SDLT to Scotland in April 2015. In April 2016 higher rates on additional properties were introduced contributing to the sharp rise in receipts in 2016-17.

**Figure 9  Receipts from Stamp taxes, 1980-2017**

The chart below shows the monthly net receipts. April 2016 represented the largest single month of SDLT receipts since the tax's introduction in 2003, and is partly explained by forestalling activity ahead of the introduction of the higher rate of SDLT on additional residential properties. Receipts for April to July 2017 are 12.8 per cent higher for Stamp taxes than in the same period last year.

**Figure 10  Receipts from Stamp taxes**

For more information, click here to find the property statistics section on our website.

---

5 The totals from 2013-14 onwards also include receipts from the Annual Tax on Enveloped Dwellings (ATED), which was introduced on 1 April 2013. Excludes SDLT devolved to Scotland from April 2015 onwards.
Hydrocarbon oil duty receipts

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Receipts as a proportion of GDP grew throughout the 1990s but have steadily declined since then, though they have continued slowly rising in cash terms.

**Figure 11** Receipts from Hydrocarbon oils, 1980-2017

Monthly receipts are relatively flat throughout the year as shown below; the troughs in receipts at the beginning of each calendar year are likely to be a result of bad weather conditions. Receipts for April to July 2017 are 0.3 per cent higher than in the same period last year.

**Figure 12** Receipts from Hydrocarbon oils

For more information on road fuel receipts, [click here to find the business taxes section of our website.](#)
Tobacco Duty receipts

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Though nominal receipts have mostly increased over the period, as a proportion of GDP, receipts have been in continuous decline, in line with reduced consumption. The dip in 1999-00 was due to activity in the illicit and cross border tobacco sectors. Receipts have been relatively flat in recent years, with duty rate increases likely to be offset by the continuing long term decline in smoking and downtrading to cheaper cigarettes and other tobacco products.

Figure 13    Tobacco Duty receipts, 1980-2017

In the graph below, the peaks are due to forestalling whereby a manufacturer will bulk release products for consumption prior to anticipated duty increases at Budget, often followed by a trough in the month or two afterwards. There can also be similar patterns of high clearances one month followed by low clearances the next month when manufacturers increase prices. Cigarettes are subject to anti-forestalling restrictions in advance of a Budget, as explained in HMRC Notice 85C. Receipts for April to July 2017 are 7.2 per cent higher than in the same period last year.

Figure 14    Tobacco Duty receipts

For more information on Tobacco receipts, click here to find the business taxes section of our website.
Alcohol Duty receipts

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Receipts continue to increase each year, although in 2014-15 the increase was smaller than in previous years. However, receipts as a percentage of GDP have declined steadily since the 1980s, though they have remained stable in recent years, mainly due to duty rate increases, until 2013 when the beer duty escalator ended and 2014 when the escalators on wine, cider and spirits duty ended.

**Figure 15** Alcohol Duty receipts, 1980-2017

![Graph showing alcohol duty receipts and percentage of GDP from 1980 to 2017. The graph indicates a trend of increased receipts but a steady decline in the percentage of GDP.](image)

The chart below highlights peaks in December receipts, as alcohol is being released for consumption during November in preparation for the Christmas period. There can also be forestalling around the time of a duty rate increase (traders will bulk release products for consumption prior to anticipated duty increases at Budget). Receipts for individual alcohol duties can fluctuate significantly around March/April due to trader behaviour in response to changes in duty rates announced at the Budget. Receipts for April to July 2017 are 0.4 per cent higher than in the same period last year.

Environmental tax receipts

The graph below shows annual revenue and revenue as a percentage of GDP since 1996-97. Environmental tax receipts covers Landfill Tax (from 1996-97), Climate Change Levy (from 2001-02), Aggregates Levy (from 2002-03) and Carbon Price Floor (from 2012-13). Carbon Price Floor was introduced in April 2013 but payments were not received until July 2013. Receipts in 2013-14 and 2014-15 have risen mainly due to the Climate Change Levy and the Carbon Price Floor. In 2015-16 receipts increased more slowly; a contributing factor being the devolution of Landfill Tax to Scotland in April 2015.

Figure 17  Receipts from Environmental taxes, 1996-2017

The chart of monthly receipts (below) shows the peak months (Apr, Jul, Oct, Jan) are when the majority of traders make their quarterly instalment payments. Receipts for April to July 2017 are 6.4 per cent lower than in the same period last year.

Figure 18  Receipts from Environmental taxes

For more information on Environmental receipts, click here to find the business taxes section of our website.

---

6 From April 2015 onwards the figures exclude Landfill Tax which was devolved to Scotland.
Air Passenger Duty Receipts

The graph below shows annual revenue and revenue as a percentage of GDP since the introduction of Air Passenger Duty in 1994-95. The sharp rises in receipts in 1998-99, 2007-08 and from 2010-11 onwards, and the decrease in 2015-16 have all been related to policy changes including rate, exemption and banding changes. Receipts as a proportion of GDP have generally followed nominal receipts.

Figure 19  Air Passenger Duty receipts, 1994-2017

The chart below shows monthly receipts throughout the year. Receipts tend to rise in summer months and fall during winter, other than an upturn in January receipts, reflecting increased travel during December. Receipts for April to July 2017 are 10.5 per cent higher than in the same period last year.

Figure 20  Air Passenger Duty receipts

For more information on APD receipts, click here to find the business taxes section of our website.
Inheritance Tax Receipts

The graph below shows annual revenue and revenue as a percentage of GDP since 1980-81. Receipts rose steadily until 2007-08 due to increases in the value of tax liable assets in this period, particularly in the value of residential property. Receipts then fell sharply due to both the introduction of the Transferable Nil Rate Band for deaths occurring from October 2007 and a fall in the value of residential property in the second half of 2008 and in most of 2009. Since 2009-10, receipts have increased both in terms of annual revenue and as a proportion of GDP. Receipts increased substantially in 2015-16 as a result of rising asset values and a higher number of deaths in the final months of 2014-15 compared to the same period in previous years.

Figure 21 Inheritance Tax receipts, 1980-2017

The chart below shows monthly receipts throughout the year. Receipts for April to July 2017 are 20.6 per cent higher than in the same period last year.
