UK Standards for Microbiology Investigations

Investigation of bile
Acknowledgments

UK Standards for Microbiology Investigations (UK SMIs) are developed under the auspices of Public Health England (PHE) working in partnership with the National Health Service (NHS), Public Health Wales and with the professional organisations whose logos are displayed below and listed on the website https://www.gov.uk/uk-standards-for-microbiology-investigations-smi-quality-and-consistency-in-clinical-laboratories. UK SMIs are developed, reviewed and revised by various working groups which are overseen by a steering committee (see https://www.gov.uk/government/groups/standards-for-microbiology-investigations-steering-committee).

The contributions of many individuals in clinical, specialist and reference laboratories who have provided information and comments during the development of this document are acknowledged. We are grateful to the medical editors for editing the medical content.

Amendment table

Each UK SMI method has an individual record of amendments. The current amendments are listed on this page. The amendment history is available from standards@phe.gov.uk.

New or revised documents should be controlled within the laboratory in accordance with the local quality management system.

UK SMI#: scope and purpose

**Users of UK SMIs**

Primarily, UK SMIs are intended as a general resource for practising professionals operating in the field of laboratory medicine and infection specialties in the UK. UK SMIs also provide clinicians with information about the available test repertoire and the standard of laboratory services they should expect for the investigation of infection in their patients, as well as providing information that aids the electronic ordering of appropriate tests. The documents also provide commissioners of healthcare services with the appropriateness and standard of microbiology investigations they should be seeking as part of the clinical and public health care package for their population.

**Background to UK SMIs**

UK SMIs comprise a collection of recommended algorithms and procedures covering all stages of the investigative process in microbiology from the pre-analytical (clinical syndrome) stage to the analytical (laboratory testing) and post analytical (result interpretation and reporting) stages. Syndromic algorithms are supported by more detailed documents containing advice on the investigation of specific diseases and infections. Quality guidance notes describe laboratory processes which underpin quality, for example assay validation.

Standardisation of the diagnostic process through the application of UK SMIs helps to assure the equivalence of investigation strategies in different laboratories across the UK and is essential for public health surveillance, research and development activities.

**Equal partnership working**

UK SMIs are developed in equal partnership with PHE, NHS, Royal College of Pathologists and professional societies. The list of participating societies may be found at [https://www.gov.uk/uk-standards-for-microbiology-investigations-smi-quality-and-consistency-in-clinical-laboratories](https://www.gov.uk/uk-standards-for-microbiology-investigations-smi-quality-and-consistency-in-clinical-laboratories). Inclusion of a logo in an UK SMI indicates participation of the society in equal partnership and support for the objectives and process of preparing UK SMIs. Nominees of professional societies are members of the Steering Committee and working groups which develop UK SMIs. The views of nominees cannot be rigorously representative of the members of their nominating organisations nor the corporate views of their organisations. Nominees act as a conduit for two way reporting and dialogue. Representative views are sought through the consultation process. UK SMIs are developed, reviewed and updated through a wide consultation process.

**Quality assurance**

NICE has accredited the process used by the UK SMI working groups to produce UK SMIs. The accreditation is applicable to all guidance produced since October 2009. The process for the development of UK SMIs is certified to ISO 9001:2008. UK SMIs represent a good standard of practice to which all clinical and public health microbiology laboratories in the UK are expected to work. UK SMIs are NICE...

---

6 Microbiology is used as a generic term to include the two GMC-recognised specialties of Medical Microbiology (which includes Bacteriology, Mycology and Parasitology) and Medical Virology.
Accredited and represent neither minimum standards of practice nor the highest level of complex laboratory investigation possible. In using UK SMIs, laboratories should take account of local requirements and undertake additional investigations where appropriate. UK SMIs help laboratories to meet accreditation requirements by promoting high quality practices which are auditable. UK SMIs also provide a reference point for method development. The performance of UK SMIs depends on competent staff and appropriate quality reagents and equipment. Laboratories should ensure that all commercial and in-house tests have been validated and shown to be fit for purpose. Laboratories should participate in external quality assessment schemes and undertake relevant internal quality control procedures.

**Patient and public involvement**

The UK SMI working groups are committed to patient and public involvement in the development of UK SMIs. By involving the public, health professionals, scientists and voluntary organisations the resulting UK SMI will be robust and meet the needs of the user. An opportunity is given to members of the public to contribute to consultations through our open access website.

**Information governance and equality**

PHE is a Caldicott compliant organisation. It seeks to take every possible precaution to prevent unauthorised disclosure of patient details and to ensure that patient-related records are kept under secure conditions. The development of UK SMIs is subject to PHE Equality objectives [https://www.gov.uk/government/organisations/public-health-england/about/equality-and-diversity](https://www.gov.uk/government/organisations/public-health-england/about/equality-and-diversity).

The UK SMI working groups are committed to achieving the equality objectives by effective consultation with members of the public, partners, stakeholders and specialist interest groups.

**Legal statement**

While every care has been taken in the preparation of UK SMIs, PHE and the partner organisations, shall, to the greatest extent possible under any applicable law, exclude liability for all losses, costs, claims, damages or expenses arising out of or connected with the use of an UK SMI or any information contained therein. If alterations are made by an end user to an UK SMI for local use, it must be made clear where in the document the alterations have been made and by whom such alterations have been made and also acknowledged that PHE and the partner organisations shall bear no liability for such alterations. For the further avoidance of doubt, as UK SMIs have been developed for application within the UK, any application outside the UK shall be at the user’s risk.

The evidence base and microbial taxonomy for the UK SMI is as complete as possible at the date of issue. Any omissions and new material will be considered at the next review. These standards can only be superseded by revisions of the standard, legislative action, or by NICE accredited guidance.

UK SMIs are Crown copyright which should be acknowledged where appropriate.
Suggested citation for this document
Scope of document

Type of specimen
Bile
This UK SMI describes the processing and bacteriological investigation of bile.
This UK SMI should be used in conjunction with other UK SMIs.

Introduction

Biliary infection can produce significant morbidity and mortality and the prognosis often depends upon whether biliary tract obstruction is present. Gram negative bacteria (mainly *Escherichia coli*) are the cause of the majority of biliary infections although Gram positive and anaerobic organisms are also found\(^1\,^2\). Biliary infection presents as either cholangitis or cholecystitis.

Bile is normally sterile, however colonisation may occur, frequently with a mixture of aerobes and anaerobes originating from the gut\(^3\). Occasionally instrumentation or stenting may lead to colonisation or infection, which may progress to bacteraemia\(^4\). Fever, previous endoscopic or percutaneous biliary instrumentation, and bilioenteric anastomosis are significant predictors of a positive bile culture\(^2\).

Cholangitis
Cholangitis is the inflammation of the biliary ducts. It may present in two forms, ascending or suppurative cholangitis\(^3\).

Ascending cholangitis
Ascending cholangitis occurs when partial obstruction of the biliary ducts and bacterial proliferation in the bile occur together\(^3\,^5\). Bacteria are shed intermittently into the bloodstream. This can develop into suppurative cholangitis. Ascending cholangitis is a common cause of sepsis following liver transplantation.

Suppurative cholangitis
Suppurative cholangitis occurs when an infected biliary system is completely obstructed. Biliary pressure increases and bacteria are constantly shed into the bloodstream. Diagnosis of infection can be made by aspirating bile and taking blood cultures (*B 37 - Investigation of blood cultures (for organisms other than *Mycobacterium* species)*).

Recurrent pyogenic cholangitis
Recurrent pyogenic cholangitis presents as episodes of right abdominal pain, biliary obstruction and cholangitis and Gram negative septicaemia in patients that are chronically infected with biliary parasites.

Cholecystitis
Cholecystitis is inflammation of the gall bladder. It is usually due to an infection that is often secondary to the presence of gallstones. When the cystic duct is obstructed by a gallstone the hydrostatic pressure in the gallbladder lumen is increased. This produces pain and infection frequently ensues.
Emphysematous cholecystitis

Emphysematous cholecystitis is an acute infective cholecystitis involving gas-forming organisms, most commonly *Clostridium perfringens*. Gangrene and perforation may result.

Endoscopic retrograde cholangiopancreatography (ERCP)

One of a variety of imaging techniques used to study the biliary tree, whereby an endoscope is passed from the gut via the ampulla of Vater into the biliary ducts. This is minimally invasive but may cause biliary sepsis.

Organisms isolated from bile include\(^3,5:\):

- Enterobacteriaceae
- *Enterococcus* species
- Pseudomonads
- *Bacteroides* species
- *Clostridium* species
- Anaerobes
- *Staphylococcus aureus*
- *Salmonella*

Other organisms may be isolated and should be given consideration depending on clinical details.

Yeast infections

Yeast infections are rare in normal individuals. They occur in older patients with malignancy, immunocompromised patients, diabetic patients or in patients receiving antimicrobial treatment for other infections. Such infections may be confined to the biliary tract or be a feature of more general candidosis. They usually involve *Candida albicans*, but other *Candida* species have been reported\(^2,6-8\).

Parasitic invasion

Parasitic invasion of the biliary tract occurs in patients from or in the developing world or those who are immunosuppressed and may involve\(^5:\):

- *Ascaris lumbricoides*
- *Clonorchis sinensis*
- *Opisthorchis* species
- *Fasciola hepatica*
- *Giardia intestinalis*
- *Cryptosporidium* species
- *Microspora*

These are described in B 31 - Investigation of specimens other than blood for parasites.
Technical information/limitations

Limitations of UK SMIs
The recommendations made in UK SMIs are based on evidence (for example, sensitivity and specificity) where available, expert opinion and pragmatism, with consideration also being given to available resources. Laboratories should take account of local requirements and undertake additional investigations where appropriate. Prior to use, laboratories should ensure that all commercial and in-house tests have been validated and are fit for purpose.

Selective media in screening procedures
Selective media which does not support the growth of all circulating strains of organisms may be recommended based on the evidence available. A balance therefore must be sought between available evidence, and available resources required if more than one media plate is used.

Specimen containers\textsuperscript{9,10}
UK SMIs use the term “CE marked leak proof container” to describe containers bearing the CE marking used for the collection and transport of clinical specimens. The requirements for specimen containers are given in the EU in vitro Diagnostic Medical Devices Directive (98/79/EC Annex 1 B 2.1) which states: “The design must allow easy handling and, where necessary, reduce as far as possible contamination of, and leakage from, the device during use and, in the case of specimen receptacles, the risk of contamination of the specimen. The manufacturing processes must be appropriate for these purposes”.

1 Safety considerations

1.1 Specimen collection, transport and storage

Use aseptic technique.
Collect specimens in appropriate CE marked leak proof containers and transport in sealed plastic bags.
Compliance with postal, transport and storage regulations is essential.

1.2 Specimen processing

Containment Level 2.

As a minimum, it is recommended that the processing of any culture that may result in generation of aerosols should be processed in a microbiological safety cabinet in accordance with the relevant risk assessment, ACDP and HSE guidelines.

Processing of diagnostic sample cultures that are assessed to be at higher risk of containing hazard group 3 organisms must be undertaken under appropriate containment conditions as determined by risk assessment, and as required by Biological agents: managing the risks in laboratories and healthcare premises. This will normally be under full CL3 conditions. Such organisms include Mycobacterium species, Brucella species, Bacillus anthracis, Blastomyces dermatitidis, Histoplasma capsulatum, Coccidiodes immitis, etc.

Diagnostic work with clinical material that could possibly contain Hazard Group 3 organisms (Salmonella Typhi and Salmonella Paratyphi A, B & C,) does not normally require full Containment Level 3 containment (paragraph 175).

Note: S. Typhi and S. Paratyphi A, B and C cause severe and sometimes fatal disease and laboratory acquired infections have been reported. S. Typhi vaccination is available. Guidance is given in the Public Health England immunisation policy.

2 Specimen collection

2.1 Type of specimens

Bile

2.2 Optimal time and method of collection

For safety considerations refer to Section 1.1.
Collect specimens before antimicrobial therapy where possible.
Unless otherwise stated, swabs for bacterial and fungal culture should be placed in appropriate transport medium.
Bile may be collected in theatre or from a closed drainage system by aspiration with a needle and syringe.
Collect specimens other than swabs into appropriate CE marked leak proof containers and place in sealed plastic bags.

2.3 Adequate quantity and appropriate number of specimens

Ideally, a minimum volume of 1mL.
Numbers and frequency of specimen collection are dependent on clinical condition of patient.

### 3 Specimen transport, storage and retention\(^{9,10}\)

#### 3.1 Optimal transport and storage conditions

For safety considerations refer to Section 1.1.

Specimens should be transported and processed as soon as possible\(^{26}\).

If processing is delayed, refrigeration is preferable to storage at ambient temperature\(^{26}\).

The volume of specimen influences the viability of anaerobes\(^{32-34}\).

The recovery of anaerobes is compromised if the transport time exceeds 3hr\(^{34}\).

Samples should be retained in accordance with The Royal College of Pathologists guidelines ‘The retention and storage of pathological records and specimens’\(^{35}\).

### 4 Specimen processing/procedure\(^{9,10}\)

#### 4.1 Test selection

Select a representative portion of specimen for appropriate procedures such as examination for parasites (B 31 - Investigation of specimens other than blood for parasites) depending on clinical details.

#### 4.2 Appearance

The presence of pus should be noted.

#### 4.3 Sample preparation

For safety considerations refer to Section 1.2.

#### 4.4 Microscopy

##### 4.4.1 Standard

Using a sterile pipette place one drop of specimen on to a clean microscope slide.

##### 4.4.2 Supplementary

Microscopy for parasites – see B 31 - Investigation of specimens other than blood for parasites.

If a Gram stain is required, spread one drop of the specimen with a sterile loop to make a thin smear on a clean microscope slide.

#### 4.5 Culture and investigation

Using a sterile pipette inoculate each agar plate and enrichment broth, if included, with specimen (see Q 5 - Inoculation of culture media for bacteriology).

For the isolation of individual colonies, spread inoculum with a sterile loop.
### 4.5.1 Culture media, conditions and organisms

* CLED agar, originally designed for urine specimens

** Prolonged 14-day incubation might be of interest in particular situations in which the prevalence of slow-growing microorganisms and anaerobes is higher; in such cases plates should be left in the incubator/cabinet, read at 5 days and then again left in the incubator/cabinet until day 14.

*** If the laboratory has an anaerobic cabinet plates may be read at 48 hours, ideally they should be left for 5 to 7 days.

#### 4.6 Identification

Refer to individual UK SMIs for organism identification.

#### 4.6.1 Minimum level of identification in the laboratory

**Note:** All work on S. Typhi and S. Paratyphi A, B & C must be performed in a microbiological safety cabinet in a Containment Level 3 room.

**4.7 Antimicrobial susceptibility testing**

Refer to [EUCAST](https://www.eucast.org) guidelines for breakpoints. Additional UK specific susceptibility testing guidance is available on [British Society for Antimicrobial Chemotherapy (BSAC)](http://www.bsac.org.uk) webpage.

**4.8 Referral for outbreak investigations**

N/A

**4.9 Referral to reference laboratories**

For information on the tests offered, turn around times, transport procedure and the other requirements of the reference laboratory [click here for user manuals and request forms](https://www.gov.uk/specialist-and-reference-microbiology-laboratory-tests-and-services).

Organisms with unusual or unexpected resistance, and whenever there is a laboratory or clinical problem, or anomaly that requires elucidation should be sent to the appropriate reference laboratory.

Contact appropriate devolved national reference laboratory for information on the tests available, turn around times, transport procedure and any other requirements for sample submission:

**England and Wales**

**Scotland**

**Northern Ireland**

Organisms may be further identified if this is clinically or epidemiologically indicated.
5 Reporting procedure

5.1 Microscopy
Report the WBCs and organisms detected.
Microscopy for parasites – see B 31 - Investigation of specimens other than blood for parasites.

5.1.1 Microscopy reporting time
Urgent microscopy results to be telephoned or sent electronically.
Written report 16–72hr.

5.2 Culture
Report clinically significant organisms isolated (with an appropriate comment on possible contamination or overgrowth if the specimen is from a collection bag or T-tube) or
Report: other growth or absence of growth.
Also, report results of supplementary investigations.
Culture reporting time.
Clinically urgent results to be telephoned or sent electronically.
Written report, 16 – 72hr stating, if appropriate, that a further report will be issued.
Supplementary investigations: Parasites – see B 31 - Investigation of specimens other than blood for parasites.

5.3 Antimicrobial susceptibility testing
Report susceptibilities as clinically indicated. Prudent use of antimicrobials according to local and national protocols is recommended.

6 Notification to PHE38,39, or equivalent in the devolved administrations40-43
The Health Protection (Notification) regulations 2010 require diagnostic laboratories to notify Public Health England (PHE) when they identify the causative agents that are listed in Schedule 2 of the Regulations. Notifications must be provided in writing, on paper or electronically, within seven days. Urgent cases should be notified orally and as soon as possible, recommended within 24 hours. These should be followed up by written notification within seven days.

For the purposes of the Notification Regulations, the recipient of laboratory notifications is the local PHE Health Protection Team. If a case has already been notified by a registered medical practitioner, the diagnostic laboratory is still required to notify the case if they identify any evidence of an infection caused by a notifiable causative agent.

Notification under the Health Protection (Notification) Regulations 2010 does not replace voluntary reporting to PHE. The vast majority of NHS laboratories voluntarily report a wide range of laboratory diagnoses of causative agents to PHE and many...
PHE Health protection Teams have agreements with local laboratories for urgent reporting of some infections. This should continue.

**Note:** The Health Protection Legislation Guidance (2010) includes reporting of Human Immunodeficiency Virus (HIV) & Sexually Transmitted Infections (STIs), Healthcare Associated Infections (HCAIs) and Creutzfeldt–Jakob disease (CJD) under ‘Notification Duties of Registered Medical Practitioners’: it is not noted under ‘Notification Duties of Diagnostic Laboratories’.

https://www.gov.uk/government/organisations/public-health-england/about/our-governance#health-protection-regulations-2010

Other arrangements exist in [Scotland]^{40,41}, [Wales]^{42} and [Northern Ireland]^{43}.

Modified GRADE table used by UK SMIs when assessing references

Grading of Recommendations, Assessment, Development, and Evaluation (GRADE) is a systematic approach to assessing references. A modified GRADE method is used in UK SMIs for appraising references for inclusion. Each reference is assessed and allocated a grade for strength of recommendation (A-D) and quality of the underlying evidence (I-VI). A summary table which defines the grade is listed below and should be used in conjunction with the reference list.

<table>
<thead>
