Detailed tables	25
Annex A: Data quality and methods	86
Annex B: Further information	93

Executive summary

This report presents statistics on abortions carried out in England and Wales in 2016.

All abortions:

- There were 190,406 abortions carried out in England and Wales in 2016, slightly lower than in 2015 (191,014).

For women resident in England and Wales, 2016:

Total number

- The total number of abortions was 185,596 in 2016, slightly lower than in 2015 (185,824) and 4.2% lower than in 2006 (193,737). The total number of abortions per year has remained relatively constant at around 185,000 since 2012.

Abortion rates

- The age-standardised abortion rate was 16.0 per 1,000 resident women aged 15-44. This is the same as 2015 and 9.1% lower than in 2006 (17.6).
- The abortion rate was highest for women at the age of 22 (at 27.9 per 1,000). The highest rate in 2015 was for women at the age of 21 (at 28.7 per 1,000).
- The under-16 abortion rate was 1.7 per 1,000 women and the under-18 rate was 8.9 per 1,000 women. Both lower than in 2015 (2.0 and 9.9 per 1,000 women respectively) and in the year 2006 (3.9 and 18.2 per 1,000 women respectively).

Location and funding of abortions

- Ninety-eight per cent of abortions were funded by the NHS. Of these, over two thirds (68%) took place in the independent sector under NHS contract, as was the case in 2015 (68%).

Gestation

- Ninety-two per cent of abortions were carried out at under 13 weeks gestation and 81% were carried out at under 10 weeks, which is slightly higher than in 2015 at 80%, and considerably higher than 2006 at 68%.

Method of abortion

- Medical abortions accounted for 62% of the total. This is higher than in 2015 (55%), and more than double the proportion in 2006 (30%).

Ground E abortions

- There were 3,208 abortions (2%) were carried out under ground E (risk that the child would be born 'seriously handicapped'). This is similar to 2015 when there were 3,213 (2%) abortions carried under ground E.

Repeat abortions

- Thirty-eight per cent of abortions in 2016 were to women who had had one or more previous abortions, the same proportion as in 2015.

Non-residents of England or Wales, 2016:

Total number

- In 2016, there were 4,810 abortions for non-residents carried out in hospitals and clinics in England and Wales compared to 5,190 in 2015. The 2016 total is the lowest in any year since 1969.

1. Introduction

- 1.1 This report presents statistics on abortions carried out in England and Wales in 2016. The Department of Health (DH) has published abortion statistics annually since 2002. These are available on the GOV.UK website¹. Statistics for years from 1974 to 2001 were published by the Office for National Statistics (ONS) in their Abortion Statistics Series AB, Nos 1 to 28. The reports for 1991 to 2001 are available electronically on request to abortion.statistics@dh.gsi.gov.uk. Statistics for years from 1968 to 1973 were published in the Registrar General's Statistical Review of England and Wales, Supplement on Abortion.

The legislative context

- 1.2 The Abortion Act 1967, as amended by the Human Fertilisation and Embryology Act 1990, permits termination of a pregnancy by a registered medical practitioner subject to certain conditions. Legal requirements apply to the certification and notification of abortion procedures. Within the terms of the Abortion Act, only a registered practitioner can terminate a pregnancy. The doctor taking responsibility for the procedure is legally required to notify the Chief Medical Officer (CMO) of the abortion within 14 days of the termination, whether carried out in the NHS or an approved independent sector place and whether or not the woman is a UK resident. The Department of Health provides a HSA4 form for this purpose. Further details are available on the GOV.UK website:

<https://www.gov.uk/government/organisations/department-of-health/series/abortion-statistics-for-england-and-wales#statistical-data-sets>

- 1.3 Except in an emergency, any treatment for the termination of pregnancy can only be carried out in an NHS hospital or an independent clinic approved for the purpose by the Secretary of State. After 24 weeks gestation, the abortion can only be carried out in an NHS hospital. Through contractual arrangements with Clinical Commissioning Groups (CCGs), a large number of approved independent sector places perform NHS-funded abortions.
- 1.4 A legally induced abortion must be certified by two registered medical practitioners as justified under one or more of the following grounds:

A the continuance of the pregnancy would involve risk to the life of the pregnant woman greater than if the pregnancy were terminated (Abortion Act, 1967 as amended, section 1(1)(c))

¹ <http://transparency.dh.gov.uk/category/statistics/abortion>

- B the termination is necessary to prevent grave permanent injury to the physical or mental health of the pregnant woman (section 1(1)(b))
- C the pregnancy has not exceeded its twenty-fourth week and that the continuance of the pregnancy would involve risk, greater than if the pregnancy were terminated, of injury to the physical or mental health of the pregnant woman (section 1(1)(a))
- D the pregnancy has not exceeded its twenty-fourth week and that the continuance of the pregnancy would involve risk, greater than if the pregnancy were terminated, of injury to the physical or mental health of any existing children of the family of the pregnant woman (section 1(1)(a))
- E there is a substantial risk that if the child were born it would suffer from such physical or mental abnormalities as to be seriously handicapped (section 1(1)(d))

or, in an emergency, certified by the operating practitioner as immediately necessary:

- F to save the life of the pregnant woman (section 1(4))
- G to prevent grave permanent injury to the physical or mental health of the pregnant woman (section 1(4))

How the statistics are produced

- 1.5 The doctor taking responsibility for an abortion is legally required to notify the Chief Medical Officer (CMO) within 14 days of the termination. Abortion notification forms (HSA4s) can be submitted online or on paper.
- 1.6 The Department of Health use a thorough process for inspecting and recording the information received on the forms in order to monitor compliance with the legislation and the extent to which best practice guidance from the Department of Health is followed. The methods used ensure that good quality accurate statistics can be derived from the data. Annex A contains further information about data quality.
- 1.7 In July 2016, an essential upgrade to the Department of Health's electronic database for recording abortion notifications was completed. All information from the previous database was migrated to the new system. The change in systems has meant that there are some minor areas of data quality that are currently not as accurately recorded as in previous years. These issues have been identified and addressed, but have left a small proportion of missing information for the following areas; place of termination, whether there was a risk to a woman's mental health for abortions performed under ground C, and late

gestation medical abortions where there was no confirmation of feticide not being used. For more information on these areas see sections 2.13, 2.16 and 2.43.

- 1.8 The format of the tables was revised in 2014 in light of the judgment handed down by the High Court in the case relating to the release of information on principal medical condition for abortions performed under ground E. A more limited degree of suppression than before 2014 has been applied, where necessary, to avoid the disclosure of personal data. This is in line with the Disclosure Control Protocol for Abortion Statistics which was published in June 2015. (See Annex A *xvii* for more detail.)
- 1.9 This publication is a National Statistic. It is a statutory requirement that National Statistics should be produced in accordance with the standards set out in the Code of Practice for Official Statistics. The UK Statistics Authority assesses all National Statistics for compliance with the Code of Practice. The results of the assessment of abortion statistics were published in February 2012 and are available at:
<https://www.statisticsauthority.gov.uk/archive/assessment/assessment/assessment-reports/report-176---statistics-on-abortion.pdf>

The Statistics Authority confirmed that the statistics could continue to be designated as National Statistics.

Implementation of the 2013 European Standard Population (ESP)

- 1.10 The European Standard Population (ESP) is a population structure which is used in the weighting of mortality or incidence data to produce age standardised rates (ASRs). Eurostat, the statistical institute of the European Union, took the decision to update the population structure to be more representative of the current population of Europe.
- 1.11 The 2013 ESP replaces the 1976 ESP used in calculating age standardised rates. Further information about the ESP and the effect on UK age standardised rates is available at <http://www.ons.gov.uk/ons/guide-method/user-guidance/health-and-life-events/revised-european-standard-population-2013--2013-esp-/index.html>. Annex A gives detail of the effect on abortion age standardised rates from the implementation of the 2013 ESP.
- 1.12 All age standardised rates presented in this publication are based on the 2013 ESP. The time series for age standardised rates using the 2013 ESP back to 1968 is presented in Table 1. To see rates using the 1976 ESP users should refer to earlier publications.
- 1.13 For abortions by individual age and by age groups other than 'all ages', a crude rate is presented.

Ground E notifications

- 1.14 Ground E abortions are those performed because of fetal abnormality at any gestation. The medical diagnoses are coded to ICD10.
- 1.15 During 2013, it was brought to the Department of Health's attention that the number of Ground E HSA4 notifications was lower than the number reported to the congenital anomaly registries. The Department of Health has worked closely with the National Down's

Syndrome Cytogenetic Register (NDSCR) to explore this discrepancy and is now working with Public Health England.

- 1.16 A matching exercise was carried out between the NDSCR data and Department of Health notifications for 2011, 2012 and 2013 data. Results from the matching suggest that a Department of Health notification was made for about 54% of NDSCR records and that almost half of Ground E notifications are missing. As recommended by the Royal College of Obstetricians and Gynaecologists, the Department of Health has been working with clinics to rectify this under-reporting. In December 2016 the Department of Health wrote to all Fetal Medicine Units, Antenatal Screening Midwives and administration staff reminding colleagues of doctors' responsibility to submit HSA4 forms to the relevant Chief Medical Officer. The letter was jointly signed by the Department of Health, Royal College of Obstetricians and Gynaecologists and Maternal and Fetal Health Medicine Society. However, despite some progress being made, it is likely there is still a significant undercount presented in the ground E notification tables in this publication, so overall figures related to ground E notifications should be treated with caution.
- 1.17 Results from the matching exercise are published at <https://www.gov.uk/government/publications/reporting-of-abortions-with-fetal-abnormalities-2013>
- 1.18 Between 2011 and 2013, there was a 17.8% increase in the submission of HSA4 Abortion Notifications for Down's syndrome.

2. Commentary

Unless specified, the following commentary, charts and tables relate to abortions carried out in England and Wales for residents of England and Wales only, rather than all abortions carried out in England and Wales. Figures do not include abortions for residents of England and Wales that are carried out in other parts of the United Kingdom or outside the UK (except in Table 13).

Overall number and rate of abortions

- 2.1 In total, there were 190,406 abortions notified as taking place in England and Wales in 2016, of which 185,596 were to residents of England and Wales. This represents an age-standardised abortion rate of 16.0 per 1,000 resident women aged 15-44². The 2016 rate is the same as 2015 (16.0 per 1,000 resident women aged 15 - 44) and is more than triple the rate of 5.1 per 1,000 resident women aged 15-44 recorded in 1969. Most recently the rate has been declining from the peak in 2007 of 17.9 abortions per 1,000 resident women, and has been relatively stable at around 16 per 1,000 women since 2011. (Table 1 and Figure 1).

² See Annex A for the 2013 ESP and how the rate is derived.

Figure 1: Age standardised abortion rate per 1,000 women aged 15-44, England and Wales, 1969 to 2016

Age

- 2.2 There were 1,564 abortions to girls aged under 16. Of these, 456 were to girls under 15 and 71 of these were to girls aged under 14.
- 2.3 The crude abortion rate in 2016 was highest for women at the age of 22 (at 27.9 per 1,000 women). The highest rate in 2015 was for women aged 21 (28.7 per 1,000 women) and in 2006 the highest rate was for women aged 19 at 34.6 per 1,000 women. Figure 2a below.
- 2.4 There were 456 abortions to women aged under 15 (0.2% of the total) and 754 to women aged 45 or over (0.4%) (Table 4a and Figure 2a).

Figure 2a: Abortions per 1,000 women by single year of age, England and Wales, 2006 and 2016

- 2.5 Abortion rates for those aged under 25 have shown some decline over the last ten years. The decline is particularly marked in the under-16 and 16-17 age groups where the rates have both halved since 2006. In particular the abortion rate in the 16-17 age group declined from a peak of 23.4 per 1,000 women in 2007, to 10.8 per 1,000 women in 2016.
- 2.6 The abortion rate for 18-19 year olds also declined from 33.3 per 1,000 women in 2006 to 23.0 per 1,000 women in 2016, and for those aged 20-24 the rate also declined from 32.5 per 1,000 women in 2006 to 27.0 per 1,000 women in 2016.
- 2.7 For women over the age of 25, abortion rates have seen marginal increases in recent years. Rates for those aged 25-29 are only slightly lower in 2016 (23.6 per 1,000 women) than 2006 (24.3 per 1,000 women), but rates have increased over the last four years, having fallen to 21.8 per 1,000 women in 2012.
- 2.8 The rates for women aged 30-34 have increased steadily from 15.0 per 1,000 women in 2006 to 17.4 in 2016, and rates for women aged 35 and over have also increased from 6.9 per 1,000 women in 2006 to 8.1 in 2016. (Table 3b and Figure 2b).

Figure 2b: Abortions per 1000 women by age, England and Wales, 2006 and 2016

Marital status

2.9 About four-fifths (81%) of abortions in 2016 were carried out on single women, a proportion that has remained roughly constant for the last 10 years. (Table 3a.v).

Ethnicity

2.10 The revised HSA4 forms introduced in 2002 allowed for the recording of ethnicity, as self-reported by the women. This information was not previously recorded. Ethnicity was recorded on 97% of the forms received for 2016 compared with 86% in 2006. Of women whose ethnicity was recorded in 2016, 77% were reported as White, 9% as Asian or Asian British and 8% as Black or Black British (Table 3a.vi).

2.11 The percentage of women having an abortion in 2016 who had had one or more previous abortions varies by ethnic group. Thirty-three per cent of Asian women having abortions in 2016 had previously had an abortion, compared with 48% of Black women (Table A below). Thirty-eight per cent of White women having an abortion in 2016 had previously had an abortion.

Table A: Percentage of women who had had an abortion in 2016 by ethnicity and number of previous abortions, England and Wales, 2016

Ethnicity	Number of previous abortions				Total number of abortions (n)
	0	1	2	3 or more	
White	62	28	8	3	138,958
Mixed	54	31	11	4	6,675
Asian or Asian British	67	25	7	2	15,804
Black or Black British	52	32	11	5	13,876
Chinese	67	24	7	3	4,066
Not known/not stated	66	25	6	2	6,217
All women	62	28	8	3	185,596

Location and funding of abortions

2.12 Table 3a.i and Figure 3 show that in 2016, 30% of abortions were performed in NHS hospitals and 68% in approved independent sector places under NHS contract (previously named NHS Agency), making a total of 98% of abortions funded by the NHS. The remaining 2% were privately funded. The proportion performed under NHS contract has been rising steadily since this information was collected in 1981, while the proportions of NHS hospital and private abortions have been falling since 1995 and 1988 respectively.

2.13 There were 4,551 abortion records for residents of England and Wales for which the hospital or clinic code was not recorded in the Department of Health database in 2016. The Department is continuing to work to ensure that this information is captured and completed.

Figure 3: Percentage of abortions by purchaser/provider, England and Wales, 1981 to 2016

Statutory grounds for abortion

- 2.14 Two medical practitioners must agree upon the grounds under which an abortion can be performed. For more information about the grounds for abortion see Section 1.4.
- 2.15 In 2016, 97% of abortions (180,794) were undertaken under ground C. A further 2% were carried out under ground E (3,208 abortions) and a similar proportion (1%: 1342 abortions) under ground D. Grounds A and B together accounted for very few abortions (246). The remaining 6 cases were performed under grounds F or G. Ground C abortions have consistently accounted for over 95% of abortions over the last 10 years. (Table 3a.ii).
- 2.16 Where the information is available³, the vast majority (99.8%) of abortions carried out under ground C alone were reported as being performed because of a risk to the woman's mental health. These were classified as F99 (mental disorder, not otherwise specified) under the International Classification of Disease version 10 (ICD-10) and therefore no further breakdown is possible within the report.
- 2.17 The main medical diagnoses for abortions performed under ground C alone which were not due to mental health or missing (60 cases) were those performed because of; complications of pregnancy (34 cases) including hypertension, excessive vomiting, diabetes, amniotic fluid disorders and premature rupture of membranes; diseases of the nervous system (6 cases); diseases of the circulatory system (4 cases); diseases of the genitourinary or musculoskeletal system (1 cases), and other maternal conditions unrelated to pregnancy such as cancer and epilepsy (15 cases).
- 2.18 At the time of publication, the cases performed under ground C that did not have enough information to allocate a diagnosis code and are being followed up.

Legal abortions performed under ground E

- 2.19 In 2016, 71% of ground E abortions were performed medically compared to 62% of all abortions (Tables 9c and 7a). The methods used for abortions performed under ground E are of importance to those working in fetal anomaly screening and medicine.
- 2.20 The age group with the highest proportion of abortions performed under ground E is 35 and over (4.3% of abortions for this age group were for ground E, 1,314 abortions), compared to 0.3% of abortions performed for women aged under 20 (69 abortions). (Table 2).
- 2.21 Congenital malformations were reported as the principal medical condition in nearly half (46%; 1,471) of the 3,208 cases undertaken under ground E. The most commonly reported malformations were of the nervous system (21% of all ground E cases; 680) and the cardiovascular system (9%; 288). Chromosomal abnormalities were reported as the principal medical condition for just over a third (37%; 1,187) of ground E cases. Down's syndrome was the most commonly reported chromosomal abnormality (22%; 706). Other

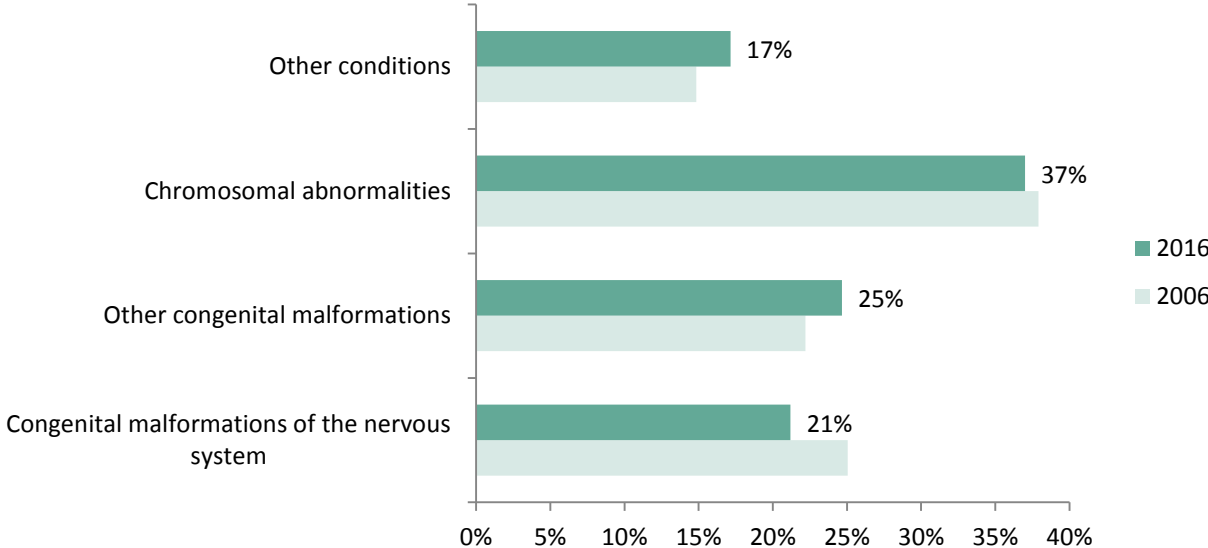

³ There were 21,951 records for abortions carried out under ground C (21,471 residents of England and Wales) that did not have a record of whether there was or was not a risk to a woman's mental health. This missing information is not due to incomplete HSA4 forms, but due to the process of migrating existing HSA4 forms onto the new department of health database.

conditions account for 17% of ground E abortions, this includes cases where the fetus was affected by maternal factors, hydrops fetalis, family history of heritable disorders, and Cystic Hygroma. (Full details in table 9a, Figure 4 and Commentary sections 1.14 and 1.15).

2.22 The Abortion Notification form HSA4 allows the recording of all medical conditions and other details associated with the ground. Table 9a shows totals for all mentions of any medical condition recorded. For example, in 2016, there were 1,926 mentions of a congenital malformation within the 3,208 Ground E cases.

2.23 No abortions in 2016 were recorded as being associated with rubella under ground E (ICD-10 code P35). In the past 10 years, there have been 2 abortions associated with rubella: 1 in 2006 and 1 in 2007.

Figure 4: Principal medical conditions for abortions performed under ground E (percentage), England and Wales, 2006 and 2016

2.24 Abortions are rarely performed under grounds F or G. In the past 10 years 16 such abortions have been reported, 1 in each of the years 2011, 2012, 2013, 4 in 2014, 3 in 2015 and 6 in 2016.

Gestation period

2.25 The vast majority of abortions are performed under 13 weeks gestation (92% in 2016). There has been a continuing increase in the proportion of abortions that are performed under 10 weeks since 2006. In 2016, 81% of abortions were performed at under 10 weeks, a similar proportion to 2015 but increasing from 68% in 2006. In 2016, 11% were performed at 10-12 weeks. This proportion has not changed since 2015, but the proportion has halved from 22% since 2006. Abortions carried out at 13 weeks or later gestation represented 9% which is unchanged from 2015 and decreasing slightly from 11% in 2006. (Table 3a.iii and Figure 5).

2.26 Department of Health policy is that women who are legally entitled to an abortion should have access to the procedure as soon as possible. Evidence shows that the risk of complications increases the later the gestation. (Table 8).

Figure 5: Percentage of abortions by gestation (weeks), England and Wales, 2006-2016

2.27 Over three quarters (81%) of NHS funded abortions took place at under 10 weeks, ranging from 66% to 89% (Table 11a).

2.28 Abortions where gestation is 24 weeks or over account for 0.1% of the total. There were 226 such abortions in 2016 (Table 5 and Table 9a), which is very similar to 230 in 2015⁴.

Previous abortions

2.29 In 2016, 38% of women undergoing abortions had had one or more previous abortions. The proportion has risen from 32% in 2006 (Table 3a.ix and Table 4b).

2.30 Thirteen per cent (unchanged from 2015) of women under 20 who had an abortion in 2016, had had one or more previous abortions. For women aged 35 and over who had an abortion in 2016, 46% (unchanged from 2015) had previously had one or more abortion. (Table 2).

⁴ In previous years and up to 2014, a distinction was made between gestations of 24 weeks plus 0 days and 24 weeks plus 1 or more days. In tables up to 2014, abortions that were 24 weeks plus 0 days were included with gestations of 23 weeks and footnoted as such. In this publication, abortions that were performed at 24 weeks plus 0 days are included in the 24 week table.

- 2.31 For women aged under 18, 568 (7%) abortions were to women who had undergone a previous abortion. For women under aged 16, 20 (1%) were repeat abortions.
- 2.32 Repeat unintended pregnancy and subsequent abortion is a complex issue associated with increased age as it allows longer for exposure to pregnancy risks (Table B).

Table B: Of women having an abortion in 2016. Percentage of women who had had one or more previous abortions, by age, England and Wales, 2016

Age	1 or more
Under 18	7%
18-19	17%
20-24	33%
25-29	45%
30-34	47%
35 or over	46%
All women	38%

Area of residence

- 2.33 Detailed tables on the numbers and rates of abortions in England and Wales are shown in tables 10 and 11. In terms of the proportion of women undergoing repeat abortions in 2016, the figures ranged from 26% to 47%. (Table 11b).
- 2.34 This variation across Local Authorities could be due to a range of factors, including random variation, but could also be influenced by local policy decisions such as differences in local practice relating to post-abortion contraception advice.

Previous obstetric history

- 2.35 Obstetric history, especially for young women is of value to those working to reduce unplanned pregnancies. In 2016, 55% of women undergoing abortions had had one or more previous pregnancies that resulted in a live or stillbirth, up from 47% in 2006 (See Table 3a.vii). Twenty per cent of women had had a previous pregnancy resulting in a miscarriage or ectopic pregnancy, up from 14% in 2006. (Table 3a.viii).

Method of abortion

- 2.36 Different methods can be used to terminate a pregnancy, depending on the duration of gestation, and other circumstances relating to the individual woman. There is one principal medical method, involving the use of the abortifacient drug Mifegyne (mifepristone, also known as RU486).
- 2.37 The main surgical methods are:
- I. vacuum aspiration, recommended at up to 15 weeks gestation
 - II. dilatation and evacuation (D&E) recommended where gestation is greater than 15 weeks

D&E may be used in combination with vacuum aspiration; such cases are recorded in the statistics as D&E.

- 2.38 In autumn 2016, restrictions were placed on the provision of surgical abortions at some clinics resulting in some women who had, or would have, opted for a surgical abortion switching to a medical procedure. Although the proportion of medical abortions compared to surgical abortions has been increasing, this change of service provision in around 30 clinics has resulted in a larger increase in the proportions of medical abortions from previous years.
- 2.39 Medical abortions accounted for 62% of total abortions in 2016. The proportion of medical abortions has more than doubled in the last ten years from 30% in 2006, and since 2014, medical abortions have been the most common method of abortion. (Table 3a.iv, Table 5 and Figure 6). There has been a continuing upward trend in medical abortions since 1991 when Mifegyne was licensed for use in the UK, when only 4% of abortions were undertaken using a medical procedure.

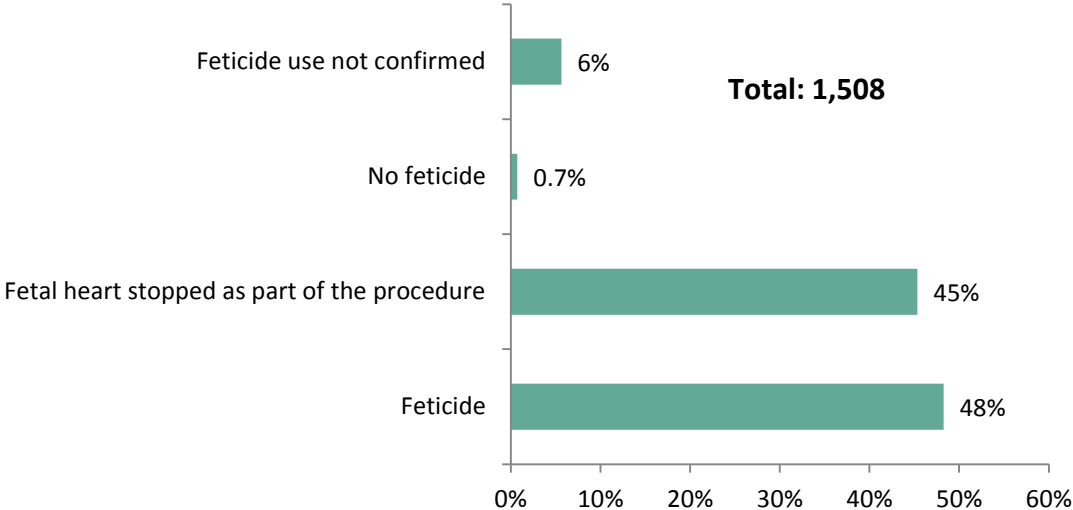

Figure 6: Percentage of abortions by method, England and Wales, 2006-2016

- 2.40 In 2016, 72% of abortions under ten weeks were medical abortions compared with 37% in 2006. (Table 7).
- 2.41 The choice of early medical abortion as a method of abortion is likely to have contributed to the increase in the overall percentage of abortions performed at under ten weeks gestation (68% in 2006 compared with 81% in 2016). Early medical abortion is less invasive than a surgical procedure and does not involve use of anaesthetics.
- 2.42 The surgical procedure vacuum aspiration was used for 33% of all abortions in 2016; and Dilatation and Evacuation (D&E) for 5% of all abortions. (Table 3a.iv and Table 7a).
- 2.43 For abortions at 22 weeks or beyond, feticide is recommended by the Royal College of Obstetricians and Gynaecologists prior to the evacuation of the uterus to stop the fetal heart. In 2016, of the 1,508 abortions performed at 22 weeks and over, 48% were reported as preceded by a feticide and a further 45% were performed by a method

whereby the fetal heart is stopped as part of the procedure. Eleven (0.7%) of abortions at 22 weeks or beyond were confirmed as having no feticide. For the remaining 89 cases (6%), at the time of publication, the Department of Health had not been able to confirm whether feticide had been performed. (Figure 7)

Figure 7: Percentage of abortions performed at 22 weeks gestation and over, England and Wales, 2016

Length of stay in hospital/clinic

2.44 It is very rare for an abortion treatment to require a stay in hospital of one or more nights. In 2016, 214 women (0.1%) were reported as having duration of stay of one or more nights in a hospital or clinic after their abortion. Thirty-four of these stays (16%) were for abortions performed at later gestations of 20 weeks and over (Table C).

Table C: Abortions requiring a length of stay of one or more nights, percentage breakdown by gestation weeks, England and Wales, 2016

Gestation	Number of abortions requiring a stay of one or more nights	% of abortions by gestation that require a stay of one or more nights
3 - 9	83	0.1%
10 - 12	34	0.2%
13 - 19	63	0.5%
20 and over	34	1.1%
All gestations	214	0.1%

Complications

2.45 Complications were reported in 294 cases in 2016, a rate of about one in every 630 abortions, which is very similar to the rate in 2015 and lower than 2006 (one in every 500; 370 cases) (Table 8).

2.46 There was one death following an abortion reported on HSA4 forms in 2016. This is the same number as 2015, and there were zero deaths in 2012, 2013 and 2014. Deaths related to pregnancy and abortion will be published in the MBRRACE_UK: Mothers and Babies: Reducing Risk through Audits and Confidential Enquiries across the UK. See:

<https://www.npeu.ox.ac.uk/mbrance-uk/programme-of-work> and
<https://www.npeu.ox.ac.uk/mbrance-uk>

Selective terminations

2.47 Pregnancies following fertility treatments such as in vitro fertilisation (IVF) may result in more than one embryo being implanted in the womb. In such cases, the outcome of the pregnancy may be more successful if the number of fetuses is reduced. This reduction usually occurs at about 12 weeks' gestation.

2.48 In 2016, there were 141 abortions which involved selective terminations, an increase since 2015 (119 cases). In 92 cases, two fetuses were reduced to one fetus. In 33 cases, three fetuses were reduced to two fetuses and in 11 cases three fetuses were reduced to one fetus. Over three quarters (78%) of the selective terminations were performed under ground E.

2.49 The number of selective terminations has increased from 72 in 2011 to 141 in 2016. However, the breakdown into the various categories remains roughly the same, see Table D below.

Table D: Selective reduction abortions by number of original foetuses, England and Wales, 2016

	Original number of fetuses					
	Total	2 reduced to 1	3 reduced to 2	3 reduced to 1	4 *	5+ *
2011	72	37	18	9	7	7
2012	82	38	28	11	5	0
2013	125	74	28	10	10	3
2014	132	80	35	14	3	0
2015	119	63	35	14	6	1
2016	141	92	33	11	5	0

*Represents the original number of fetuses prior to any selective reduction.
Numbers are not broken down further for these two groups due to disclosure control.

2.50 Abortions that are selective abortions are more likely to be for women who are married (39% of women who have a selective reduction are married compared to 16% for all women who had an abortion), aged 30 and over (80%, compared to 35% of all women who had an abortion) and are less likely to have had a previous abortion: less than 12% of cases reported a previous abortion compared to 38% for all women.

Chlamydia screening

2.51 The revised HSA4 forms introduced in 2002 allowed for the recording of whether chlamydia screening was offered. The Royal College of Obstetricians and Gynaecologists recommend that all women undergoing an abortion should be screened for *C. trachomatis* and undergo a risk assessment for other STIs. Chlamydia is the most commonly diagnosed STI in England. Infection of varying degrees of severity may occur after medical or surgical abortion and is usually caused by pre-existing infection. Prophylactic antibiotic use and bacterial screening for lower genital tract infection reduces this risk. Analysis of returned data for 2016 shows that 87% of women having abortions in 2016 were offered chlamydia screening, up from 72% in 2006. (Table 3a.x). The figure for women aged under 20 is slightly higher (92%).

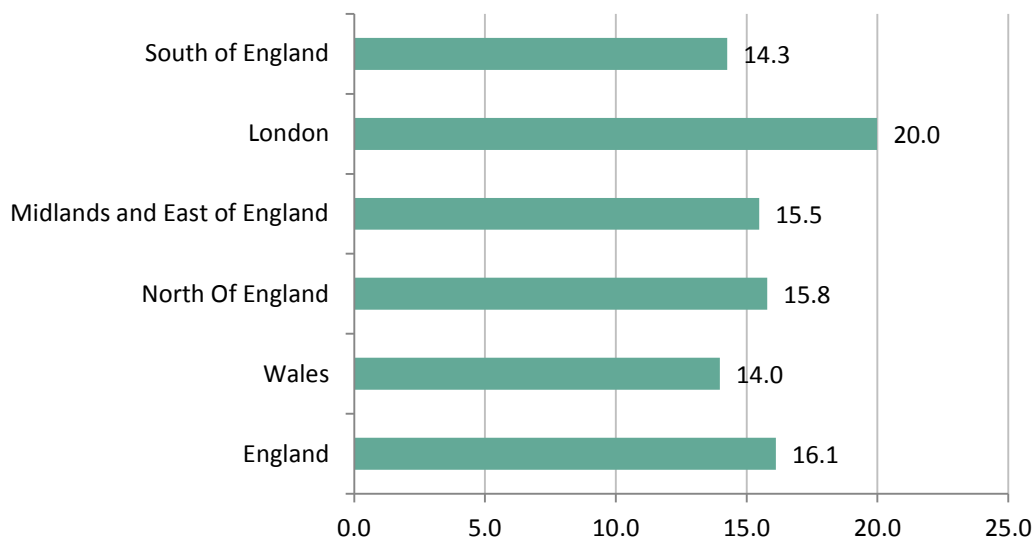

Place of residence within England and Wales

2.52 The details of place of residence provided on the HSA4 form are used to allocate each record to a Clinical Commissioning Group (CCG) for analysis. For Wales, records are allocated to their equivalents, Local Health Boards. Tables 10a, 10b, 11a and 11b show information for these areas.

2.53 Similarly the place of residence details are used to allocate each record to a Local Authority (LA) and tables 10c, 10d, 11c and 11d show information by LA.

2.54 Rates vary by region with London showing the highest rate at 20 per 1,000 women aged 15-44. See Figure 8.

Figure 8: Abortions per 1,000 women aged 15-44, by region in England and Wales, 2016

Women resident outside England and Wales

2.55 In 2016, there were 4,810 abortions to women resident outside England and Wales, compared with 5,190 in 2015. Principally, 68% of non-residents were from the Irish Republic and 15% were from Northern Ireland. (Table 12a and Figure 9).

2.56 The number of abortions to non-residents has fallen each year since 2003, when the figure was 9,078. The 2016 number is the lowest in any year since 1969 (Table 1 and Table 12a).

Figure 9: Legal abortions to non-residents of England and Wales, 2006-2016

Abortions carried out in Great Britain

2.57 Data for abortions carried out in Great Britain is shown in table 13. The information for abortions performed in Scotland was published by the Scottish Government on 30th May 2017. <http://www.isdscotland.org/Health-Topics/Sexual-Health/Abortions/>

¹ ICD-10 codes are taken from the International Statistical Classification of Diseases and Related Health problems (Tenth Revision) published by the World Health Organisation (WHO)

² the all mentions totals show abortions where more than one medical condition is reported. Totals therefore do not equal the number of abortions performed under Ground E
additional breakdown may be available by ICD-10 code on request.

³ There was an additional 1 case not performed under Ground E at 24 weeks and over gestation making the total 226, see table 5

* Cases where diagnosis is 'not known' are being followed up

Note: percentages are rounded and may not add up to 100

Table 9b: Legal abortions performed under ground E by gestation weeks, residents of England and Wales, numbers, 2016

England and Wales, residents		numbers					
Procedure	Gestation weeks for abortions performed under ground E						
	Total	under 13	13 & 14	15 & 16	17 to 19	20 & 21	22 and ove
Total abortions	3,208	370	798	523	448	562	507
Surgical	920	214	351	179	83	41	52
Vacuum Aspiration	386	159	227	0	0	0	0
Dilatation and Evacuation	411	30	102	162	72	32	13
Feticide with a surgical evacuation ¹	123	25	22	17	11	9	39
Medical	2,288	156	447	344	365	521	455

¹ rates for CCGs and LOs are based on mid-2015 population estimates. Age standardised rates are calculated using 2013 ESP. See Annex A for further details.
rates for all ages, under 16, under 18 and 35 and over are based on populations 15-44, 13-15, 15-17 and 35-44 respectively
.. value suppressed to protect patient confidentiality

.. Adhering to ISD Statistical Disclosure Control Protocol. See annex B

. Not available

¹ Some notifications record more than one Statutory Ground, therefore totals may not match with the numbers released by ISD Scotland.

² Two cases where method of diagnosis was not known were included in total for 'medical'.

Source: ISD Scotland, Department of Health

Note: percentages are rounded and may not add up to 100

Annex A: Data Quality and Methods

Validation

- i. The Department of Health use a thorough process for inspecting and recording the information received on the forms in order to monitor compliance with the legislation and the extent to which best practice guidance from the Department of Health is followed. Selected forms are scrutinised by a medical practitioner who may request further detail from the patient's medical record via the terminating doctor. Further details of the checks that are made on the data are available on the GOV.UK web site at:

<https://www.gov.uk/government/publications/abortion-notification-forms-for-england-and-wales>

Data collected

Not all the information collected on form HSA4 is necessary for statistical purposes and some of the information that is used to monitor the Abortion Act is not stored electronically other than on scanned images of the forms. The scanned images of the forms are part of the system for processing the forms and they are kept for three years.

The following information is not stored:

- Terminating and certifying doctors' names
- Terminating and certifying doctors' addresses
- Terminating doctor's GMC number
- Patient name
- Patient reference including NHS number
- Patient address
- Detail about any medical conditions other than ICD10 Codes

Derived fields

Some of the data used in the tables are derived variables. More detail about these calculations is shown below:

- *Reported Date of Termination* is from the date of the surgical treatment or, for medical abortions, the date of prostaglandin or other medical agent. If a feticide is used, this date takes priority.
- *Age at Termination* is taken from Reported Date of Termination (see above) minus date of birth. *Age at termination* is collected in whole years.
- *Purchaser* is derived from information given about how the abortion was funded (NHS or Privately) together with clinic type (NHS hospital, Independent Sector, Private hospital). For example, a privately funded abortion within an Independent Sector organisation will be 'privately funded' and an NHS funded abortion within an Independent Sector clinic will be 'NHS Funded: Independent Sector'.
- *Area of residence (CCG/LA/region)* is derived from postcode of the woman's residence.

- *Duration of stay* is derived from date of discharge minus date of admission.

Forms returned after the publication cut-off date

- ii. The 2016 figures in this annual bulletin are based on a snapshot of the records taken about four weeks prior to publication. A small number of notifications have been, and will continue to be, received after this cut-off date. Whilst these additional notifications are processed and the information retained in line with our retention policy, they are not included in future statistical releases. So, for example, figures for 2014 published in the 2014 bulletin have not been revised in this year's bulletin. This policy of not revising statistics is taken for three main reasons:
- to prevent the disclosure of personal information arising from small differences in published tables;
 - to ensure consistency in published outputs over time; and
 - because the revisions would be small in scale and therefore of little value.
- iii. The scale of the effect is illustrated below for 2015. A further 902 notifications were received after the cut-off, equating to around half a per cent of the published total. 9 of these late notifications were for abortions over 23 weeks. 91 were for ground E abortions. This number of late ground E forms is disproportional to the total number (around 10% of late forms were for ground E compared to 2% overall), which could be due to the increased awareness around likely under reporting of ground E forms. However, as the table below shows, the inclusion of this information would have resulted in little change in the percentage breakdowns by age group, gestation and grounds to one decimal place.

Table E: Examples of the effect on the statistics of forms returned after the publication cut-off date, England and Wales, 2015

	Published 2015 figures	2015 figures incorporating notifications received after the publication cut-off
Total abortions	185,824	186,726
Gestation (weeks)		
3 to 9	80.2%	80.2%
10 to 12	11.4%	11.4%
13 to 19	6.8%	6.8%
20 or over	1.5%	1.6%
Not known	N/A	0%
Grounds		
E	1.7%	1.8%
Other	98.3%	98.2%
Age		
Under 20	14.1%	14.9%
20 to 34	70.1%	69.8%
35 or over	15.9%	15.4%

Incomplete information and imputation

- iv. Incomplete and incorrectly completed forms are returned to practitioners for completion and clarification. In a very small number of cases (about one-quarter of one percent), the information remains unavailable at the time of publication. Date of birth was missing from 51 records in 2015, gestation information from 117, postcodes from 218 and grounds from 44.
- v. For the purposes of constructing statistics, values for missing items are imputed. Records with missing ages were assigned pro-rata to the 20-24 age group, as this is the modal age group, accounting for 28% of abortions. Missing gestations were imputed as 6, 7, 8, 9 or 10 weeks in equal distribution unless the method of abortion or diagnosis suggested otherwise. Missing postcodes were imputed with a random postcode from within the main local authority of other residents attending the same hospital or clinic. Missing grounds were imputed as ground C unless information on the form suggested otherwise.

Population estimates used for rates of abortion

- vi. Abortion rates are calculated using the conventional age range for women in their child bearing years, 15 – 44.
- vii. Abortion rates per 1,000 women for 2016 at a national level and at CCG level were calculated using the mid-2015 population estimates for England, Wales, England and Wales, Clinical Commissioning Groups and Locality Office, as published at 23rd June

2015⁵. Rates for earlier years were calculated using the latest population estimates available at the time the relevant annual reports were produced and have not been revised, either by using population estimates for the year in question or by using updated population estimates.

Deriving age standardised rates of abortion

- viii. Age standardised rates allow comparison between populations which may contain different proportions of people of different ages. The European Standard Population (ESP) is a widely used artificial population structure for the calculation of directly age standardised rates. The replacement of the ESP first used in 1976 with an updated version published in 2013 resulted in an increase of all-cause mortality rates for England and Wales by 85% and all-site cancer incidence rates for England by some 48%. Figures using the 1976 and 2013 ESPs are therefore not comparable. Information about this change in methods can be found on the ONS website at: <http://www.ons.gov.uk/ons/guide-method/user-guidance/health-and-life-events/revised-european-standard-population-2013--2013-esp-/index.html>
- ix. The effect of implementing the 2013 ESP for abortion age standardised rates is small. The vast majority of abortions occur within the age range 15-44. The 1976 ESP assumed equal populations at each single age between 15-44 (see Annex table 1 below). The 2013 ESP made only a small change to the populations within age range 15-44 such that although not equal, it remains fairly uniform. Thus, the 2013 ESP brings the abortion age standardised rates down by about 4% in recent years and 2% in earlier years. The time series using 2013 ESP age standardised rates back dated to 1968 is presented in Table 1 of the detailed tables.
- x. The formulae used to calculate the age-standardised abortion rates are given below.

For the analysis of trends in abortion rates for England and Wales:

$$\text{Age Standardised Rate} = \frac{\sum_{\text{all ages } i} \text{rate}_i \text{ESP}_i}{\sum_{i=15}^{44} \text{ESP}_i}$$

Where 'rate_i' is the crude rate for women aged i and ESP_i is the population of women aged i in the 2013 European Standard Population.

⁵ Available at

<https://www.ons.gov.uk/peoplepopulationandcommunity/populationandmigration/populationestimates/bulletins/annualmidyearpopulationestimates/mid2015>

For the area analyses in table 10b:

$$\text{Age Standardised Rate} = \frac{\sum_{i=15}^{44} \text{rate}_i \text{ESP}_i}{\sum_{i=15}^{44} \text{ESP}_i}$$

where the rate for women aged under 16 (rate 15) =

$$\frac{\text{number of abortions to women under 16}}{\text{population of 15 year olds}}$$

and the rate for women aged 44 and over (rate 44) =

$$\frac{\text{number of abortions to women aged 44 and over}}{\text{population of 44 year olds}}$$

Annex table 1: European Standardised Population

Age group	1976 ESP	2013 ESP
Under 1	1,600	1,000
1-4	6,400	4,000
5-9	7,000	5,500
10-14	7,000	5,500
15-19	7,000	5,500
20-24	7,000	6,000

Confidence intervals

- xi. The figures recorded in this report are the outcome of a stochastic process – that is, they are influenced by chance or random processes such as fertilisation. Each recorded figure is only one of a range of results that could have occurred under the same circumstances if those random processes had led to different outcomes. It is often the underlying circumstances or process that is of interest and the actual value observed gives only an imprecise estimate of this ‘underlying risk’. For example, users are often interested in understanding whether there has been a change in rates of abortion, perhaps reflecting a change in the prevalence of risky sexual behaviour, a change in attitudes towards the options available in pregnancy or a change in access to services. To assess this, it is necessary to determine if the observed change is one that is unlikely to be the result of random fluctuation and therefore offers evidence that a real change has occurred.
- xii. A confidence interval can be calculated around each observed value, which gives a range in which the expected or average value resulting from the underlying process is likely to fall. The 95 per cent confidence intervals have been calculated for some of the observed values in tables 10a, 10b, and 10c. These are known as such, because if it were possible to repeat the underlying process under the same conditions a large number of times (that is, ‘rerun’ the year over and over again), 95 per cent of the confidence intervals calculated in this way would contain the average value from those runs. When assessing the observed results for the year, it is usual to assume that there is only a 5 per cent chance that the expected or average value falls outside the 95 per cent confidence interval.
- xiii. The confidence interval may be used to compare an estimate against a target or benchmark value. If the target or benchmark value is outside the confidence interval it can be inferred that the difference between the estimate and the target is statistically significant at the 95 per cent confidence level.
- xiv. Confidence intervals are also often used to compare two observed values (for example, abortion rates within two regions.) Sometimes in such cases statistical testing is undertaken by seeing if the two confidence intervals overlap. This is quick and easy to do, but not necessarily conclusive: whilst it is safe to assume that non-overlapping confidence intervals indicate a statistically significant difference, it is not always the case that overlapping confidence intervals do not.
- xv. The method for estimating a confidence interval varies depending on whether it is for a percentage, count, crude rate or standardised rate. The methods used are those detailed in the Association of Public Health Observatories’ Technical Briefing 3: Commonly used public health statistics and their confidence intervals.
- xvi. For example, the 95 per cent confidence interval associated with:
- The figure of 185,596 for the total number of abortions of residents in England and Wales is 184,762 – 186,451 (Table 10a);
 - The age standardised rate of 16.0 abortions per 1000 resident women aged 15-44 in England and Wales is 15.95 – 16.06 (Table 10b);

Disclosure Control

- xvii. The Data Protection Act 1998 places a statutory obligation on the Department of Health to ensure that the statistics we release on abortion do not relate to a living individual who can be identified from those data alone or in conjunction with other available information, unless the conditions laid out in the Act are met. In recent years, the Department has attempted to meet this obligation by following the disclosure guidance for abortion statistics developed by the Office for National Statistics in July 2005. A judgment was handed down in 2011 by the High Court in a case relating to the release of information on principal medical condition for abortions performed under Ground E, showed that the disclosure controls set out in the guidance were overly cautious in some circumstances. The format of the tables in the annual report have therefore been revised, with a more limited degree of suppression applied, where still necessary to avoid the disclosure of personal data.
- xviii. The Department published the Disclosure Control Protocol for Abortion Statistics in June 2015 which can be found at:
<https://www.gov.uk/government/collections/abortion-statistics-for-england-and-wales>

Geographical coding and naming

- xix. On 1st January 2011, the Government Statistical Service introduced a new coding and naming policy for statistical geographies. Nine-digit codes have been developed to ensure consistency when comparing geographical areas as the geographical area covered by an NHS organisation is susceptible to change. These unique markers have been added to the relevant tables within this publication.
- xx. In 2015, NHS England granted approval for the following CCGs to merge with effect from the 1st April 2015. NHS Gateshead CCG (00F), NHS Newcastle North and East CCG (00G) and NHS Newcastle West CCG (00H) will merge to form NHS Newcastle Gateshead CCG. A new ODS code of 13T has been allocated to the new organisation.
- xxi. On the 1st April 2013 Clinical Commissioning Groups assumed commissioning of termination of pregnancy services under the health system reforms. Further information on the Coding and Naming for Statistical Geographies is available at:
<http://www.ons.gov.uk/ons/guide-method/geography/geographic-policy/coding-and-naming-for-statistical-geographies/index.html>

Rounding

- xxii. Percentages are subject to rounding and totals may not agree with the sum of the component figures shown. Rates are also rounded.

Symbols

- xxiii. The following symbols are used in the tables:
- . = not applicable
 - .. = suppressed value to protect patient confidentiality
