

Regional level aggregate farm accounts for England

Second estimate for 2016

This release presents the second estimate of Total Income from Farming (TIFF) in England and each of the English regions for 2016. These statistics show the trends in Total Income from Farming and the contribution that the agricultural industry makes to the regional economy. These estimates include minor revisions to both 2015 and 2016 data since the first estimate.

A comprehensive data series can be found <u>here</u>, under the heading "Agriculture in the English Regions – dataset".

All data relate to 2016, are in current price terms and comparisons are with 2015 unless stated otherwise.

Key points:

- Total Income from Farming in England fell by 13% (£363 million) to £2,530 million.
- Total Income from Farming in the United Kingdom is £3,682 million; England is the largest contributor accounting for 69% of this total, Scotland 20%, Northern Ireland 7% and Wales 4%. Detailed United Kingdom figures can be found <u>here</u>.
- In England, agriculture contributed £6,289 million (0.42%) to the economy (Gross Value Added) and 1.1% of people employed worked in agriculture.
- Total Income from Farming decreased in all England regions in 2016. The South East and South West showed the largest falls of around 20% each, followed by the East Midlands 17% and North West 15%.

Latest figures for England (2016 compared to 2015)

Total Income from Farming fell between 2015 and 2016 by 13% (£363 million) to £2,530 million.

The greatest contribution to the total value of output was production of milk (£2,098 million), followed by poultry meat (£1,868 million), wheat (£1,491 million), cattle reared for meat (£1,303 million), fresh vegetables (£1,201 million) and plants & flowers (£1,130).

Gross Value added at basic price, which identifies agriculture's contribution to the Gross Domestic Product (GDP) fell by £406 million (-6.1%) to £6,289 million.

Direct payments to farmers increased by £157 million (9%) to £1,948 million as a result of the more favourable sterling/euro exchange rate.

<u>Outputs</u>

In England the overall value of crops fell by £392 million to £7,056 million and accounted for 41% of the total value of agricultural output. After the record highs of the previous year, crop yields returned to more typical levels driving down volumes and although prices strengthened towards the end of 2016 this was not enough to offset the low prices seen early in the year.

The value of wheat fell by £416 million (-22%) to £1,491 million. Planted area remained little changed and more average yields resulted in lower volumes. Price was also lower overall, despite the upturn in prices towards the end of the year.

The value of barley decreased by £109 million (-18%) to £499 million, driven by both price and volume.

The value of oilseed rape fell by around a quarter to £502 million. A reduced planted area, the lowest for almost 10 years, and reduced yield largely driving this decrease.

The value of sugar beet fell by £23 million (-14%) to £150 million. Lower prices and a reduction in planted area for the fifth year running were largely responsible for this fall.

The value of potatoes rose by a third to £501 million. An increase in planted area along with higher prices contributed to this rise.

Overall, the total value of output of livestock was 4.2 % lower at £8,298 million and accounted for just under half of the total value of agricultural output.

The value of milk, the largest contributor to the value of outputs, fell by £285 million (-12%) to \pounds 2,098 million, driven by lower price and production. A combination of poorer grass quality due to the variable weather conditions and dairy farmers attempting to reduce costs such as supplementary feeds led to reduced production. In 2016 (calendar year) the United Kingdom average price of milk was 22.6 pence per litre (ppl) compared to 24.5 ppl in 2015.

The value of livestock primarily for meat was virtually unchanged at £4,854 million.

Intermediate consumption

The value of intermediate consumption fell by £307 million to £10,901 million. Reduced fertiliser, animal feed and energy costs were the main contributors to this fall.

The cost of fertiliser fell by £94 million (-9%) to £943 million, entirely price driven as the significantly lower oil prices at the beginning of the year put downward pressure on price overall.

The cost of energy fell by £40 million to £826 million, again largely driven by the decline in world oil prices which kept overall price down along with the continued drive to be more energy efficient.

The cost of animal feed, the largest contributor to the value of inputs, fell by ± 160 (-5.1%) million to $\pm 2,972$ million due to a combination of both lower price and volume. Depressed cereal prices at the beginning of the year helped keep the average annual price lower combined with the reduced use as farmers strive to make efficiencies.

Latest figures and trends for England by region

Total Income from Farming decreased in all England regions in 2016. The South East and South West showed the largest falls of around 20% each, followed by the East Midlands 17% and North West 15%.

Chart 2.1 shows the value of crop and livestock output in each region. Livestock output is most predominant in the South West and North West while crop output is greatest in the East of England. Table 2.1 presents regional summary measures from the production and income accounts whilst table 2.2 presents regional share for the main components of the account in 2016.

Table 2.2: Regional share of England total for the main components of the production and income account in 2016

The East of England region contributed just over one quarter of the total income from farming for England followed by Yorkshire & the Humber with 17% and the South West 14% and the East Midlands 13%. As a comparison, chart 2.2 below shows the value of TIFF in the regions in 2016 and the area farmed in that year.

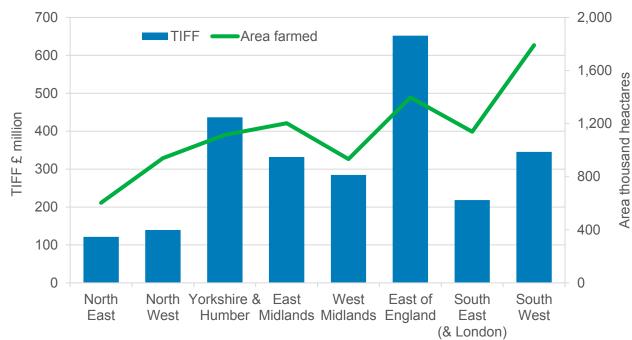

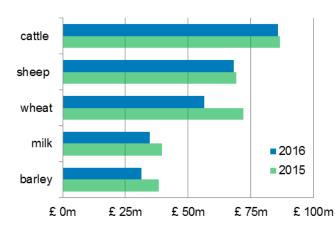

Chart 2.2: TIFF and area farmed in 2016 for English regions

North East region

In 2016 Total Income from Farming in the North East region fell to £121 million, a decrease of 12% or £16 million, accounting for 5% of the England total value.

The greatest contribution to the value of gross agricultural output came from cattle reared for meat at £86 million, followed by sheep meat production (£68 million), wheat production (£56 million), milk production (£35 million) and barley (£31 million).

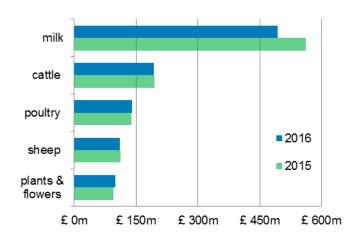

The North East contributed £222 million (0.4%) to the economy and agriculture employed 0.9% of the regional workforce. The area farmed was 603 thousand hectares; permanent grass accounted for 43%, cropped area 27% and rough grazing 20%. Table 3.1 shows the main components of the North East agricultural account, more detailed information and a longer time series can be found here, under the heading "dataset".

Table 3.1 Summary production and income account for the North East region

North West region

Chart 3.2: North West selected output

In 2016 Total Income from Farming in the North West region fell to £139 million, a fall of 15% or £24 million, accounting for 6% of the England total value.

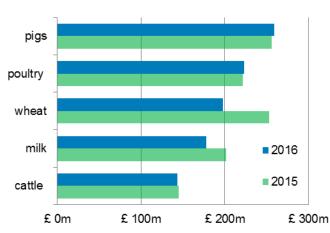

The greatest contribution to the value of gross agricultural output came from production of milk at £494 million, followed by cattle reared for meat (£193 million), poultry meat production (£140 million) and sheep meat production (£110 million) and plants and flowers (£100 million).

The North West contributed £621 million (0.4%) to the economy and agriculture employed 1.0% of the regional workforce. The area farmed was 940 thousand hectares; permanent grass accounted for 62%, cropped area 13% and rough grazing 12%. Table 3.2 shows the main components of the North West agricultural account, more detailed information and a longer time series can be found <u>here</u>, under the heading "dataset".

Yorkshire & the Humber region

Chart 3.3: Yorkshire & the Humber selected output

In 2016 Total Income from Farming in the Yorkshire & the Humber region fell to \pounds 437 million, a decrease of 10% or \pounds 46 million, accounting for 17% of the England total value.

The greatest contribution to the value of gross output came from pig meat production at $\pounds 259$ million, followed by poultry meat production ($\pounds 223$ million), wheat ($\pounds 198$ million), milk production ($\pounds 178$ million) and cattle reared for meat production ($\pounds 144$ million).

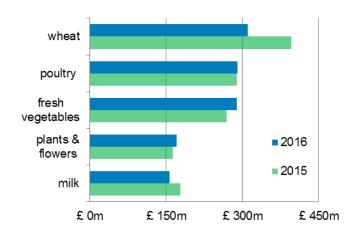

The Yorkshire & the Humber contributed £799 million (0.7%) to the economy and agriculture employed 1.3% of the regional workforce. The area farmed was 1,115 thousand hectares; permanent grass accounted for 33%, cropped area 48% and rough grazing 9%. East Midlands region

In 2016 Total Income from Farming in the East Midlands region fell to £332 million, a decrease of 17% or £68 million, accounting for 13% of the England total value.

The greatest contribution to the value of gross output came from wheat production at £310 million, followed by poultry meat production (£291 million), fresh vegetables (£288 million), plants and flowers (£171 million) and production of milk (£156 million).

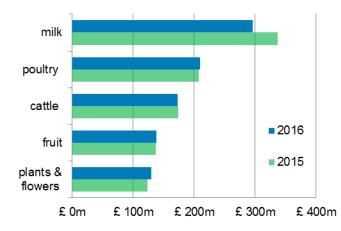

The East Midlands contributed £779 million (0.8%) to the economy and agriculture employed 1.5% of the regional workforce. The area farmed was 1,203 thousand hectares; permanent grass accounted for 23%, cropped area 63% and rough grazing 2%. Table 3.4 shows the main components of the East Midlands agricultural account, more detailed information and a longer time series can be found <u>here</u>, under the heading "dataset".

West Midlands region

In 2016 Total Income from Farming in the West Midlands region fell to £285 million, a decrease of 9% or £28 million, accounting for 11% of the England total value.

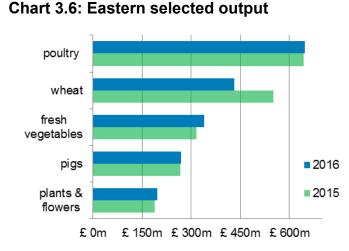

The greatest contribution to the value of gross output came from milk production at £296 million, followed by poultry meat production (£209 million), cattle reared for meat production (£173 million), fruit (£138 million) and plants and flowers (£130 million).

The West Midlands contributed £770 million (0.6%) to the economy and agriculture employed 1.6% of the regional workforce. The area farmed was 932 thousand hectares; permanent grass accounted for 40%, cropped area 42% and rough grazing 1%. Table 3.5 shows the main components of the West Midlands agricultural account, more detailed information and a longer time series can be found <u>here</u>, under the heading "dataset".

Table 3.5: Summary production and income account for the West Midlands region

Eastern region

In 2016 Total Income from Farming in the Eastern region fell to £652 million, a decrease of 6% or £45 million, accounting for 26% of the England total value.

The greatest contribution to the value of gross output came from poultry meat production at $\pounds 648$ million, this was followed by wheat production ($\pounds 431$ million), fresh vegetables ($\pounds 339$ million), pig meat production ($\pounds 269$ million) and plants and flowers ($\pounds 197$ million).

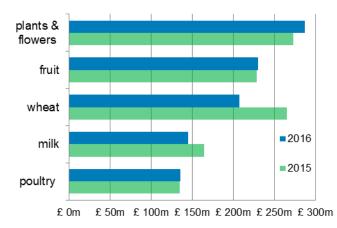

The Eastern region contributed £1,181 million (0.8%) to the economy and agriculture employed 1.3% of the regional workforce. The area farmed was 1,398 thousand hectares; permanent grass accounted for 12%, cropped area 76% and rough grazing 1%. Table 3.6 shows the main components of the Eastern region agricultural account, more detailed information and a longer time series can be found <u>here</u>, under the heading "dataset".

South East (incl London) region

In 2016 Total Income from Farming in the South East region fell to £218 million, a decrease of 20% or £55 million, accounting for 9% of the England total value.

The greatest contribution to the value of gross output came from plant & flowers at £287 million, followed by fruit (£230 million), wheat (£207 million), milk production (£145 million) and poultry meat production (£136 million).

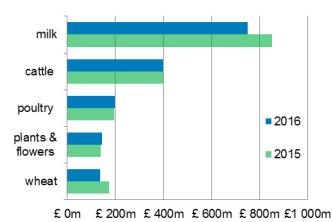

The South East contributed £817 million (0.1%) to the economy and agriculture employed 0.5% of the regional workforce. The area farmed was 1,139 thousand hectares; permanent grass accounted for 33%, cropped area 48% and rough grazing 2%. Table 3.7 shows the main components of the South East agricultural account, more detailed information and a longer time series can be found <u>here</u>, under the heading "dataset".

Table 3.8: Summary production and income account for the South West region

Description of Total Income from Farming

Total Income from Farming is income generated by production within the agriculture industry including subsidies and represents business profits and remuneration for work done by owners and other unpaid workers. It excludes changes in the values of assets, including stocks, due to price changes but includes non-agricultural activities such as further processing or tourist activities where these cannot be separated from the agricultural business. It is the preferred measure of aggregate income for the agricultural industry conforming to internationally-agreed national accounting principles required by the UK National Accounts and by Eurostat.

Total Income from Farming is designed to show the performance of the whole of the agricultural industry. A measure of farm incomes, Farm Business Income, designed to compare performance across different types of farming, is available by Government Office Regions in the publication Farm Accounts in England 2016/2017at: https://www.gov.uk/government/statistics/farm-accounts-in-england

Definition of terms used in this release

Agricultural industry - All activities taking place within businesses that carry out any agricultural activities. These businesses include all farms and specialist agricultural contractors.

Gross Fixed Capital Formation (GFCF) in livestock - Is the production of animals that will be used as the means of production, e.g. breeding animals.

Other agricultural activities - Agricultural activities that do not result in sales of final product, e.g. quota leasing, contract work.

Inseparable non-agricultural activities - Non-agricultural activities that are included within the business level accounts and are inseparable, e.g. some cases of bed and breakfast and recreation facilities.

Output at market prices - Output excluding subsidies. The output of the agricultural industry includes some non-agricultural activities and transactions within the industry.

Basic prices - Market price plus directly paid subsidies that are linked to production of specific product.

Subsidies (less taxes) on product - Subsidies and taxes linked to the production of an agricultural product. All subsidies are recorded on an 'as due' basis.

FISIM - Financial Intermediation Services Indirectly Measured (FISIM) is an estimate of the value of services provided by financial intermediaries, such as banks, for which no explicit charges are made, and which are paid for as part of the margin between rates applied to savers and borrowers.

Intermediate consumption - Goods and services consumed or used as inputs in the productive process e.g. feed, seeds, fertiliser, and pesticides.

Gross Value Added - Gross output less intermediate consumption.

Consumption of fixed capital - The reduction in value (at current prices) of capital assets used in the production process, e.g. buildings, plant, machinery, vehicles and livestock.

Net Value Added - Gross Value Added at basic prices less consumption of fixed capital.

Other subsidies on production - Subsidies and taxes not linked to production of a specific product, e.g. Single Payment Scheme, agri-environment payments, animal disease compensation.

Net Value Added at factor cost - Net Value Added at basic prices plus other subsidies (less taxes) on production.

Compensation of employees - The full costs of employees to the business including national insurance contributions.

Total Income from Farming - Income to those with an entrepreneurial interest in the agricultural industry, e.g. farmers, partners, spouses and most other family workers.

Regional classification

The Nomenclature of Units for Territorial Statistics (NUTS) provides a single uniform breakdown for the production of regional statistics for the EU. In this release, statistics are presented at the NUTS1 level of regions in England.

Information on Nomenclature of Units for Territorial Statistics (NUTS) and Local Administrative Units (LAU) can be found at:

https://www.ons.gov.uk/methodology/geography/ukgeographies/eurostat.

Regional production and income accounts methodology

Values for England are derived from the production and income account for the United Kingdom and similar accounts for Northern Ireland, Scotland and Wales. The regional accounts for England are constructed by apportioning values for England over NUTS 1 regions on the basis of crop and livestock standard outputs (SOs), which are estimated by applying coefficients to crop areas and livestock numbers.

<u>Outputs</u>

In general, the allocation is based on crop areas and livestock numbers. Regional variation in yields and prices are catered for by using standard outputs that assume one "standard" output for each type of commodity across a wide region. England is split into three regions: north, east and west. By applying the standard output to the area of wheat, say, one obtains an estimate of the value added – these value added estimates are used to make the allocation. Subsidies on output products are also apportioned in this way.

Non-agricultural output is apportioned based on total standard output (totalled over all agricultural outputs). This approach is crude but justified because it is a relatively small item in the account. Services between agricultural units (contract work) are apportioned based on total standard output. Transfers of store animals between regions can be ignored. Firstly imported livestock are, by convention, treated as negative contributions to output and not as input costs, and so there is no impact at all on input costs. Secondly, by using estimates of

gross margins for each type of animal, each region is allocated a full value added for all of its livestock.

Intermediate consumption

Consumption of inputs relates only indirectly to areas of crops and numbers of livestock. Therefore, data underlying the standard output estimates is used along with crops areas and livestock numbers to apportion input costs. Underlying the estimates of each of the standard outputs are the costs of each key type of input that are required to produce each key type of output. For example, we have estimates of the costs of animal feed per dairy cow per year. Many of these estimates are based on results of special studies and not on regular data sources. The allocation for a particular input is therefore derived as the sum of input contributions - one contribution for each type of output. The contribution associated with an output is still based on the area or livestock count.

<u>Labour</u>

Regional labour statistics from the annual June Survey are used to apportion compensation of employees. It is assumed that pay rates are the same across all the regions. Differences in the levels of part time work are accounted for. The annual June Survey provides statistics on both full time and part time workers. Standard factors are used to convert the number of part time workers into a smaller number of full time equivalents. Similarly, the volume of unpaid labour is apportioned on the basis of regional labour statistics from the annual June Survey.

Interest, rent and other subsidies on production

Interest payments and taxes are allocated based on the total standard output (totalled over all types of output). Rent received and rent paid for land or land & buildings is allocated on areas rented and owned. Environmental subsidies are not based on administrative data but on crop areas and livestock numbers. As environmental subsidies grow, it will become necessary to find a proper data source for their allocation into the regions.

Revisions

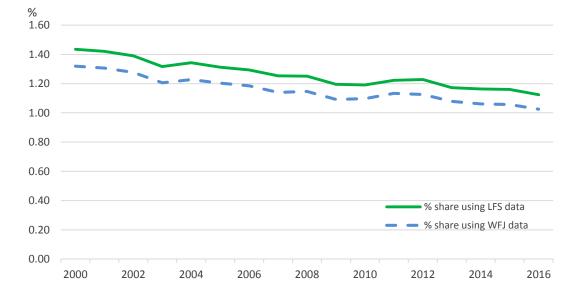

Over time, as more data becomes available, estimates will be revised and forecasts replaced, for example intermediate consumption and other costs data for 2015 and 2016 estimated in the September publication have been replaced by Farm Business Survey data.

In addition, values for England are derived from similar accounts for, Scotland, Wales and Northern Ireland. Any revisions made by the devolved authorities due to improvements or corrections in methodology or receipt of new data will impact on these regional accounts data. For further details see <u>Scottish Government</u>, <u>Welsh Government</u> and <u>Department of Agriculture and Rural Development</u>, <u>Northern Ireland</u>.

New methodology for measuring agriculture's share of employment in the regions was introduced in September 2017. Previously agriculture's share of employment by region was estimated by comparing agriculture labour numbers from June Surveys, Censuses of Agriculture and total workforce numbers from the ONS Workforce Jobs (WFJ). When the

figures were reviewed it was found the % share of employment was underestimated as Workforce Jobs measures the number of jobs rather than number of people employed and there will be many people doing more than one job. ONS Labour Force Survey (LFS) data measures the number of people in work and is, therefore, a more accurate indicator of agriculture's % share of employment when compared to June Survey data.

Revisions were introduced from 2000. Chart 4.1 compares England's agricultural share of employment estimates when calculated using Workforce Jobs and Labour Force Survey data from 2000 to 2016.

Source: Defra, June Survey data, ONS Labour Force Survey, ONS Workforce Jobs

Further development work is planned, including a full methodology review. The aim is to improve the design and quality of the Agriculture in the English region statistics and publish results using revised methodology in June 2018.

Gross Value Added and Total Income from Farming are sensitive to small percentage changes in the values of output and intermediate consumption. As a result, there are small revisions to the percentage share agriculture contributed to the economy in England and the English regions. Updated historical figures are published in the dataset and can be found at https://www.gov.uk/government/publications/agriculture-in-the-english-regions.

Summary quality report

A summary quality report for Total Income from Farming at the UK level can be found at: <u>https://www.gov.uk/government/organisations/department-for-environment-food-rural-affairs/series/aggregate-agricultural-accounts/</u> (see "Total income from farming - quality report"). This report pulls together key qualitative information on the various dimensions of quality as well as providing a summary of methods used to compile the output. It relates to estimates of Total Income from Farming and aim to provide users with information on usability and fitness for purpose of these estimates.

Quality Assurance

Defra has in place quality assurance processes to check the accuracy and reliability of the aggregate agricultural accounts that includes:

- Ongoing review of methods employed in the calculation of the accounts.
- Assessment of the quality of the estimates of components of the accounts with internal experts.
- Discussion of components of the accounts with external experts.
- Quality assessments made by Eurostat, the statistical office of the European Union.

Main users and uses of the aggregate agricultural accounts

The aggregate agricultural accounts are used in conjunction with other economic information to:

- Inform policy decisions and to help monitor and evaluate current policies relating to agriculture in the UK by Government and in the European Union by the European Commission.
- Inform stakeholders of the performance of the agricultural industry.
- Inform research into the economic performance of the agricultural industry.
- Total Income from Farming sets the context when looking at a number of policies; the agricultural industry contributes around £9 billion to the UK economy and accounts for about 0.5% of UK GDP. It is most relevant to policies relating to CAP reform and the competitiveness of farming.

User engagement

As part of our ongoing commitment to compliance with the Code of Practice for Official Statistics (<u>http://www.statisticsauthority.gov.uk/assessment/code-of-practice/index.html</u>), we wish to strengthen our engagement with users of these statistics and better understand the use made of them and the types of decisions that they inform. Consequently, we invite users to make themselves known, to advise us of the use they do, or might, make of these statistics, and what their wishes are in terms of engagement. Feedback on this notice and enquiries about these statistics are also welcome.
