The main signs and symptoms

Meningitis:
- fever
- very bad headache
- vomiting
- stiff neck
- dislike of bright lights
- rash
- confusion, delirium
- severe sleepiness, losing consciousness
- seizures

Septicaemia:
- fever and shivering
- vomiting
- severe pains and aches in limbs and joints
- very cold hands and feet
- pale or mottled skin
- rapid breathing
- diarrhoea and stomach cramps
- red or purple 'bruised' or blotchy rash on skin* that do not fade under pressure – do the glass test shown overleaf
- difficulty walking or standing
- severe sleepiness, losing consciousness

Make sure you and your friends look out for each other and that someone knows if you or a friend are unwell so they can keep an eye on you. This could be life-saving!

Be aware, be prepared

Meningococcal meningitis and septicaemia (blood poisoning) are rare but severe diseases that can kill or leave people with life changing disabilities and health problems.

Teenagers, and university students in particular, are at increased risk. But you can protect yourself against four kinds of meningococcal disease by getting your free MenACWY vaccine.

Protect yourself with MenACWY vaccine

Most UK teenagers and young adults born after August 1996 have already had MenACWY vaccine but they remain eligible up to their 25th birthday. Students of any nationality entering a UK university for the first time who have not had MenACWY vaccine are also eligible up to their 25th birthday. If you fit either of these groups and have not yet had the vaccine book an appointment with your GP practice now. If you are unsure discuss this with your GP practice.

MenACWY vaccine is very effective at preventing meningococcal meningitis and septicaemia caused by MenA, MenC, MenW and MenY.

But remember that this vaccine can’t prevent all forms of meningitis and septicaemia. So it is very important that you are aware of the signs and symptoms.

Does MenACWY vaccine protect against Men B?

No, Men B is caused by different strain of the bug which commonly affects young infants. A different vaccine, which protects against MenB, is given to very young babies. Some adults and older children may be eligible on the NHS. You can find out more about how to get the MenB vaccine through the charity websites listed overleaf.

Look out for your friends and fellow students

Many of the early signs – vomiting, fever, aches, general tiredness and headaches – are also signs of less serious illnesses like colds and flu but someone with meningitis or septicaemia will usually become seriously ill in a matter of hours. It is also potentially very serious and can kill.

This is why it is very important to keep checking someone who is ill so you know if they are getting rapidly worse and to keep looking for signs and symptoms. Seek medical help urgently if you become concerned about their or your own health.

It’s important too to look for cold hands and feet, severe limb pain and pale and blotchy skin, as these tend to develop early in the illness. Symptoms such as a rash that doesn’t fade (do the glass test shown opposite), being confused or delirious, or too sleepy to wake are very serious.

How is meningitis spread?

The bacteria that cause these diseases are spread by coughing, sneezing and intimate kissing. Most cases happen individually but outbreaks sometimes occur, usually where people live or work closely together, such as university halls of residence.

Have your MenACWY vaccine at your GP practice. In some areas it may be available at your pharmacy.

Know the signs and symptoms of meningitis and septicemia

The glass test
Press the side of a glass firmly against the rash so you can see if it fades under pressure. If it doesn’t fade, get medical help immediately. If you are feeling very ill, get help anyway, even if the rash fades or doesn’t appear at all.
