PHE Weekly National Influenza Report

Summary of UK surveillance of influenza and other seasonal respiratory illnesses
22 November 2018 – Week 47 report (up to week 46 data)

This report is published weekly on the PHE website. For further information on the surveillance schemes mentioned in this report, please see the PHE website and the related links at the end of this document.

**Summary – Week 46 (ending 18 November 2018)**
- Influenza activity remains low with sporadic cases of influenza detected in the community and all indicators Below Baseline threshold levels.
- The impact of flu on healthcare services is Below Baseline threshold levels for hospitalisations and ICU/HDU admissions.
- RSV activity continues to increase with impact particularly in young children.

**Community**
- Twenty-two new acute respiratory outbreaks have been reported in the past 7 days. Fifteen outbreaks were reported from care homes where 1 tested positive for influenza A(not subtyped), 1 was positive for RSV, 5 were positive for rhinovirus, 1 tested positive for human metapneumovirus (hMPV) and another was positive for enterovirus. Three outbreaks were reported from hospitals where 1 tested positive for influenza A(H1N1)pdm09, another tested positive for influenza A(H3) and the third was positive for RSV. One outbreak was reported from a school which tested positive for RSV. The remaining 3 outbreaks were from the Other settings category, where 2 tested positive for influenza A(not subtyped).
- During the week, 36.6% of GP practices had increased ILI consultations, 32.4% had increased severe ILI consultations and 27.6% had increased respiratory consultations.

**Primary Care**
- The rate of influenza-like illness (ILI) was Below Baseline threshold levels. The overall weekly ILI GP consultation rate was 5.2 per 100,000 registered population in participating GP practices for England, similar to 5.3 per 100,000 in week 45.
- In the devolved administrations, ILI rates were also Below Baseline threshold levels.

**Secondary Care**
- Hospitalisation rate observed was Below Baseline threshold levels, with a rate of 0.20 per 100,000 trust catchment population for England (21 NHS Trusts), this is similar to 0.19 per 100,000 in week 45.
- ICU/HDU admission rate observed was Below Baseline threshold levels, with a rate of 0.02 per 100,000 trust catchment population for England (137/143 NHS Trusts), this is the same as 0.02 per 100,000 in week 45.
- There was no new influenza admissions reported from the 6 Severe Respiratory Failure centres in the UK.

**All-cause mortality**
- In week 46 2018, no statistically significant excess all-cause mortality by week of death was seen overall and by age group in England. In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed in Scotland, Northern Ireland and Wales.

**Microbiological surveillance**
- **Primary care**: 1 sample tested positive for influenza (1 influenza A(H1N1)pdm09) with a positivity of 2.4% through the UK GP sentinel schemes.
- **Secondary care**: Influenza percent positivity was 2.5%, Below Baseline threshold levels, similar to from 2.6% in week 45. Forty-six detections were recorded through the DataMart scheme (16 influenza A(H1N1)pdm09, 6 influenza A(H3), 19 influenza A(unknown subtype) and 5 influenza B). RSV positivity continues to increase at 17.9% with the highest positivity amongst the <5 year olds stabilising at 42.0%.
- For further information and guidance on RSV see NICE guidance.

**Vaccination**
- **Weekly uptake**: Up to week 46 2018, in 94.8% of GP practices the provisional proportion of people in England who had received the 2018/19 influenza vaccine in targeted groups was: 36.6% in under 65 years in a clinical risk group, 37.8% in pregnant women and 57.7% in 65+ year olds. In 95.1% of GP practices reporting for the childhood collection the provisional proportion vaccinated was: 31.6% in 2 year olds and 32.4% in 3 year olds.
- Provisional data from the first monthly collection of influenza vaccine uptake for children of school years reception to year 5 shows 20.5% in school year reception age, 20.7% in school year 1 age, 19.9% in school year 2 age, 19.7% in school year 3 age, 18.9% in school year 4 age and 18.2% in school year 5 age were vaccinated by 31 October 2018.

**International situation**
- In the temperate zone of the Northern hemisphere, influenza activity remained at inter-seasonal levels. Increased influenza was reported in some countries of Southern and South East Asia. In the temperate zones of the Southern hemisphere, influenza activity returned to nearly inter-seasonal levels. Worldwide, seasonal influenza subtype A viruses accounted for the majority of detections.
Community surveillance

Twelve new acute respiratory outbreaks were reported in the past 7 days.

- Acute respiratory disease outbreaks
  - Twelve new acute respiratory outbreaks have been reported in the past 7 days. Fifteen outbreaks were reported from care homes where 1 tested positive for RSV, 5 were positive for rhinovirus, 1 tested positive for human metapneumovirus (hMPV) and another was positive for enterovirus. Three outbreaks were reported from hospitals where 1 tested positive for influenza A(H1N1)pdm09, another tested positive for influenza A(H3) and the third was positive for RSV. 1 outbreak was reported from a school which tested positive for RSV. The remaining 3 outbreaks were from the Other settings category, where 2 tested positive for influenza A (not subtyped).

- Medical Officers of Schools Association (MOSA) & PHE surveillance scheme
  - Boarding schools in England within the MOSA network are recruited each season to report various respiratory related illnesses including influenza like illnesses (ILI). For the 2018/19 season, 20 MOSA schools have agreed to participate in the scheme, including a total of 6,350 boarders.
  - The overall rate (all boarders) for week 46 was 0.0 per 1,000 boarders compared to 0.4 per 1,000 boarders in week 45.
  - If you are a MOSA school and would like to participate in this scheme, please email mosa@phe.gov.uk for more information.

- FluSurvey
  - Internet-based surveillance of influenza-like illness in the general population is undertaken through the FluSurvey. A project run by PHE to monitor ILI activity in the community.
  - The overall ILI rate (all age groups) for week 46 was 28.2 per 1,000 (421,489 people reported at least 1 ILI) (Figure 3), with the highest rate seen in the 45+ year olds (36.6 per 1,000).
  - If you would like to become a participant of the FluSurvey project please do so by visiting the https://flusurvey.net/en/accounts/register/ website for more information.
In week 46, the overall weekly influenza-like illness (ILI) GP consultation rate remained low and below the baseline threshold in England. In the devolved administrations, ILI rates were below baseline levels.

- **GP ILI consultations in the UK**

**RCGP (England)**
- The weekly ILI consultation rate through the RCGP surveillance was at 5.2 per 100,000 registered population in participating GP practices in week 46, this is similar to 5.3 per 100,000 in week 45. This is below the baseline threshold (13.1 per 100,000) (Figure 4*). By age group, the highest rates were seen in 1-4 year olds (11.6 per 100,000) and 15-44 year olds (6.4 per 100,000).

**UK**
- In week 46, overall weekly ILI consultation rates across the countries of the UK were all below their respective baseline thresholds (Table 1).
- By age group, the highest rates were seen in the 45-64 year olds in Scotland and Northern Ireland (5.9 per 100,000 and 8.3 per 100,000 respectively) and in the 75+ year olds in Wales (9.7 per 100,000).

**GP In Hours Syndromic Surveillance System (England)**
- The weekly ILI consultation rate through the GP In Hours Syndromic Surveillance system was at 4.1 per 100,000 in week 46 (Figure 5).

During week 46, there were further increases in respiratory syndromes, bronchiolitis (ED attendances) and bronchitis/bronchiolitis (GP OOH) in children aged <1 year. Calls for coughs in children aged <5 years and difficulty breathing in children aged <1 year also continued to increase (NHS 111). This is in line with recent increases in laboratory reports for respiratory syncytial virus (RSV). There were further small increases in GP in hours consultations for upper respiratory tract infections.

Figure 5 represents a map of GP ILI consultation rates in week 46 across England by PHE centres, with influenza-like illness surveillance MEM thresholds applied.

ILI consultation rates presented for each uTLA on the map should be interpreted in context of regional and national ILI activity; as MEM thresholds are calculated (based on previous influenza seasons from 2012/13 onwards) separately for each of the nine PHE centres and uTLA rates are then compared to Centre-level thresholds only, therefore uTLAs with higher background rates than the Centre may appear to have higher ILI activity.

- For further information, please see the syndromic surveillance [webpage](https://www.gov.uk/guidance/sources-of-uk-flu-data-influenza-surveillance-in-the-uk#clinical-surveillance-through-primary-care).
In week 46 2018, there were 18 hospitalised confirmed influenza cases (10 influenza A(H1N1)pdm09, 2 influenza A(unknown subtype) and 6 influenza B) reported through the USISS sentinel hospital network across England (21 NHS Trusts). There were 9 new admissions to ICU/HDU with confirmed influenza (2 influenza A(H1N1)pdm09 and 7 influenza A(unknown subtype)) reported through the USISS mandatory ICU/HDU surveillance scheme across the UK (137/143 NHS Trusts in England).

- USISS sentinel weekly hospitalised confirmed influenza cases, England (week 46)

- In week 46, there were 18 hospitalised laboratory confirmed influenza cases (10 influenza A(H1N1)pdm09, 2 influenza A(unknown subtype) and 6 influenza B) reported from 21 NHS Trusts across England through the USISS sentinel hospital network, with a rate of 0.20 per 100,000 trust catchment population compared to 0.19 per 100,000 in the previous week (Figures 6 and 7). This is below the baseline impact threshold of 0.89 per 100,000.

- A total of 64 hospitalised confirmed influenza admissions (27 influenza A(H1N1)pdm09, 6 influenza A(H3N2), 16 influenza A(unknown subtype) and 15 influenza B) and have been reported in the UK since week 40 2018 via the sentinel scheme.

- Number of new admissions and fatal confirmed influenza cases in ICU/HDU (USISS mandatory ICU scheme), UK (week 46)

- In week 46, there were 9 new admissions to ICU/HDU with confirmed influenza (2 influenza A(H1N1)pdm09 and 7 influenza A(unknown subtype)) reported across the UK (137/143 Trusts in England) through the USISS sentinel ICU/HDU surveillance scheme, with a rate of 0.02 per 100,000 trust catchment population compared to 0.19 per 100,000 in the previous week (Figures 8 and 9). This is below the baseline impact threshold of 0.89 per 100,000. One flu laboratory confirmed death was reported to have occurred in ICU in week 46 in the UK.

- A total of 38 new ICU/HDU admissions (16 influenza A(H1N1)pdm09, 19 influenza A(unknown subtype) and 3 influenza B) and 2 confirmed deaths have been reported in the UK since week 40 2018.

*The Moving Epidemic Method (MEM) has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for ICU/HDU admission rates for the start of influenza activity (based on 6 seasons) in a standardised approach across Europe. For MEM threshold values, please visit: https://www.gov.uk/guidance/sources
- USISS Severe Respiratory Failure Centre confirmed influenza admissions, UK (week 46)
  - In week 46, there were no new admissions for laboratory confirmed influenza among the 6 Severe Respiratory Failure (SRF) centres in the UK.
  - Since week 40 there has been 1 confirmed influenza admission (1 influenza A(unknown subtype)) to ECMO centres

**All-cause mortality data**

In week 46 2018, no statistically significant excess all-cause mortality by week of death was observed overall and by age group in England, through the EuroMOMO algorithm. In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed in Scotland, Wales and Northern Ireland in week 46 2018.

- All-cause death registrations, England and Wales
  - In week 45 2018, an estimated 10,151 all-cause deaths were registered in England and Wales (source: Office for National Statistics). This is an increase compared to the 9,529 estimated death registrations in week 44 2018.

- Excess all-cause mortality by age group, England, Wales, Scotland and Northern Ireland
  - In week 46 2018 in England, no statistically significant excess mortality by week of death above the upper 2 z-score threshold was seen overall, by age group and subnationally (all ages), after correcting ONS disaggregate data for reporting delay with the standardised EuroMOMO algorithm. This data is provisional due to the time delay in registration; numbers may vary from week to week.
  - In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed in Scotland, Wales and Northern Ireland in week 46 2018 (Table 2).

| Table 2: Excess mortality by UK country, for all ages* |
|-----------------|-----------------|
| **Country**     | Excess detected in week 46 2018? | Weeks with excess in 2018/19 |
| England         | ×                | NA                           |
| Wales           | ×                | NA                           |
| Scotland        | ×                | NA                           |
| Northern Ireland| ×                | NA                           |

* *Excess mortality is calculated as the observed minus the expected number of deaths in weeks above threshold

* NA refers to data not available for this week

Figure 10: Weekly observed and expected number of all-age all-cause deaths, with the dominant circulating influenza A subtype, England, 2014 to week 46 2018

*Note: Delays in receiving all registered deaths from April 2018, following changes in IT systems at ONS, may result in some delays in the model to adjust for most recent deaths.
Microbiological surveillance

In week 46 2018, 1 sample tested positive for influenza (1 influenza A(H1N1)pdm09) with a positivity of 2.4% through the UK GP sentinel schemes. Forty-six positive detections were recorded through the DataMart scheme (16 influenza A(H1N1)pdm09, 6 influenza A(H3), 19 influenza A(unknown subtype) and 5 influenza B) with a positivity of 2.5%, this is below the baseline threshold of 9.2%.

- Sentinel swabbing schemes in England (RCGP) and the Devolved Administrations
  - In week 46, 1 sample tested positive for influenza (1 influenza A(H1N1)pdm09) with an overall positivity of 2.4% compared to 3.0% in week 45 through the UK GP sentinel swabbing schemes (Figure 11).
  - Since week 40, a total of 13 samples (8 influenza A(H1N1)pdm09, 1 influenza A(H3), 2 influenza A(unknown subtype) and 2 influenza B) tested positive for influenza through this scheme.

- Respiratory DataMart System (England)
  - In week 46 2018, out of the 1,881 respiratory specimens reported through the Respiratory DataMart System, 46 samples (2.5%) were positive for influenza (16 influenza A(H1N1)pdm09, 6 influenza A(H3), 19 influenza A(unknown subtype) and 5 influenza B) (Figure 12), which is below the MEM baseline threshold for this season of 9.2%.
  - The highest positivity for RSV by age group was seen in the <5 year olds stabilising at 42.0% in week 46 (Figure 13).
  - Rhinovirus positivity decreased from 12.1% in week 45 to 10.7% in week 46.
  - Adenovirus positivity decreased slightly from 3.5% in week 45 to 3.0% in week 46. Parainfluenza and human metapneumovirus (hMPV) positivities remained low (Figure 14).

*The Moving Epidemic Method has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for GP ILI consultations for the start of influenza activity in a standardised approach across Europe. The threshold to indicate a likelihood of influenza community circulation for DataMart % positive as calculated through the Moving Epidemic Method is 9.2% in 2018/19.*
**Virus characterisation**

PHE characterises the properties of influenza viruses through one or more tests, including genome sequencing (genetic analysis) and haemagglutination inhibition (HI) assays (antigenic analysis). These data are used to compare how similar the currently circulating influenza viruses are to the strains included in seasonal influenza vaccines, and to monitor for changes in circulating influenza viruses. The interpretation of genetic and antigenic data sources is complex due to a number of factors, for example, not all viruses can be cultivated in sufficient quantity for antigenic characterisation, so that viruses with sequence information may not be able to be antigenically characterised as well. Occasionally, this can lead to a biased view of the properties of circulating viruses, as the viruses which can be recovered and analysed antigenically, may not be fully representative of majority variants, and genetic characterisation data does not always predict the antigenic characterisation.

The PHE Respiratory Virus Unit has characterised 3 influenza A(H3N2) viruses detected since week 40. Genetic characterisation of these A(H3N2) viruses shows that they belong to genetic subclade 3C.2a1. The Northern Hemisphere 2018/19 influenza A(H3N2) vaccine strain belongs in genetic subclade 3C.2a1.

Genetic characterisation of 5 influenza A(H1N1)pdm09 viruses detected since week 40 shows that they all belong in the genetic subgroup 6B.1, which was the predominant genetic subgroup in the 2017/18 season. Nine A(H1N1)pdm09 viruses have been antigenically characterised and are similar to the A/Michigan/45/2015-like Northern Hemisphere 2018/19 (H1N1)pdm09 vaccine strain.

One influenza B virus has been characterised where sequencing of the haemagglutinin (HA) gene shows it belongs within genetic clade 1A of the B/Victoria lineage, in a subgroup characterised by deletion of two amino acids in the HA. The N.Hemisphere 2018/19 B/Victoria-lineage quadrivalent and trivalent vaccine component virus (a B/Colorado/06/2017-like virus), is a double deletion subgroup virus.

**Antimicrobial susceptibility**

-Table 3 shows in the 12 weeks up to 18 November 2018, the proportion of all lower respiratory tract isolates of *Streptococcus pneumoniae, Haemophilus influenza, Staphylococcus aureus*, MRSA and MSSA tested and susceptible to antibiotics. These organisms are the key causes of community acquired pneumonia (CAP) and the choice of antibiotics reflects the British Thoracic Society empirical guidelines for management of CAP in adults.

**Table 3: Antimicrobial susceptibility surveillance in lower respiratory tract isolates, 12 weeks up to 18 November 2018, E&W**

*Macrolides = erythromycin, azithromycin and clarithromycin*
• Up to week 46 2018, in 94.8% of GP practices reporting weekly to ImmForm, the provisional proportion of people in England who had received the 2018/19 influenza vaccine in targeted groups was as follows (Figure 15):
  - 36.6% in under 65 years in a clinical risk group
  - 37.8% in pregnant women
  - 57.7% in 65+ year olds

![Figure 15: Cumulative weekly influenza vaccine uptake by target group in England](image)

• In 2018/19, all 2 and 3 year-olds continue to be eligible for flu vaccination, through their GPs.
  Up to week 46 2018, in 95.1% of GP practices reporting weekly to ImmForm, the provisional proportion of children in England who had received the 2018/19 influenza vaccine in targeted groups was as follows (Figure 16):
  - 31.6% in 2 year olds
  - 32.4% in 3 year olds

![Figure 16: Cumulative weekly influenza vaccine uptake by target group in England](image)

• Provisional data from the first monthly collection of the influenza vaccine uptake by frontline healthcare workers show 46.3% were vaccinated by 31 October 2018 from 95.4% of all organisations, compared to 46.0% vaccinated in the previous season by 31 October 2017. The report provides uptake at national, NHS England local team and Trust-level.
• Provisional data from the first monthly collection of influenza vaccine uptake for children of school years Reception, 1, 2, 3, 4 and 5 age (from a sample of 100% of all Local Authorities in England) show the provisional proportion of children in England who received the 2018/19 influenza vaccine via school, pharmacy or GP practice by 31 October 2018 in targeted groups as follows:
  o 20.5% in children school year reception age (4-5 yrs)
  o 20.7% in children school year 1 age (5-6 yrs)
  o 19.9% in children school year 2 age (6-7 yrs)
  o 19.7% in children school year 3 age (7-8 yrs)
  o 18.9% in children school year 4 age (8-9 yrs)
  o 18.2% in children school year 5 age (9-10 yrs)

International Situation

In the temperate zone of the Northern hemisphere, influenza activity remained at inter-seasonal levels. Increased influenza was reported in some countries of Southern and South East Asia. In the temperate zones of the Southern hemisphere, influenza activity returned to nearly inter-seasonal levels. Worldwide, seasonal influenza subtype A viruses accounted for the majority of detections

• Europe updated on 16 November 2018 (Joint ECDC-WHO Europe Influenza weekly update)

Influenza activity was low throughout the European Region.

For week 45, 7 (1.0%) of the 681 sentinel specimens tested positive for influenza viruses. All 7 were type A viruses and of the 5 subtyped, 2 (40.0%) were influenza A(H1N1)pdm09 and 3 (60.0%) were influenza A(H3N2).

A subset of Member States monitor severe disease related to influenza virus infection by surveillance of hospitalised laboratory-confirmed influenza cases in ICUs or other wards or severe acute respiratory infections (SARI). Among the 12 laboratory confirmed influenza cases in ICUs reported during week 45, 11 were influenza type A and 1 was influenza type B. Among the 15 cases of hospitalised laboratory confirmed influenza in other wards reported during week 45, there were 13 were with influenza type A and 2 with influenza type B virus infection.

For week 45, 210 specimens from non-sentinel sources (such as hospitals, schools, primary care facilities not involved in sentinel surveillance, or nursing homes and other institutions) tested positive for influenza viruses. Of the 210, 185 (88.1%) were type A and 25 (11.9%) type B viruses. Of the 56 influenza A viruses that were subtyped, 34 (60.7%) were A(H1N1)pdm09 and 22 (39.3%) were A(H3N2). None of the influenza B viruses from non-sentinel specimens were assigned to a lineage

For week 45, data from the 22 countries or regions reporting to the EuroMOMO project indicated all-cause mortality to be at expected levels for this time of year.

• United States of America updated on 16 November 2018 (Centre for Disease Control report)

During week 45, influenza activity remains low in the United States although small increases in activity were reported.

Influenza A and B viruses continue to co-circulate with influenza A(H1N1)pdm09 most commonly reported by public health laboratories.

Nationwide during week 45, the proportion of outpatient visits for influenza-like illness (ILI) increased slightly to 1.9%, which is below the national baseline of 2.2%. One of 10 regions reported the proportion of outpatient visits for ILI at or above their region-specific baseline levels. The proportion of outpatient visits for ILI ranged from 1.0% to 2.8%

The proportion of deaths attributed to pneumonia and influenza (P&I) was below the system-specific epidemic threshold in the National Center for Health Statistics (NCHS) Mortality Surveillance System.

• Canada updated on 16 November 2018 (Public Health Agency report)

Overall, influenza activity continued to increase in week 45. The influenza season has started earlier than in recent years.
In week 45, a total of 509 laboratory confirmed detections of influenza were reported, of which 97% were influenza A. The percentage of tests positive for influenza from sentinel laboratories remained above the seasonal threshold of 5.0% at 9.6%. The percentage of positive tests for influenza A is higher for this time of year compared to previous 8 seasons.

In week 45, 2.0% of visits to healthcare professionals were due to ILI, the percentage of visits for ILI is within expected levels.

To date this season, 218 influenza-associated hospitalisations were reported by participating provinces and territories, 99% of which were associated with influenza A.

- **Global influenza update** updated on 30 October 2018 (WHO website)

In the temperate zone of the Northern hemisphere, influenza activity remained at inter-seasonal levels. Increased influenza was reported in some countries of Southern and South East Asia. In the temperate zones of the Southern hemisphere, influenza activity returned to nearly inter-seasonal levels. Worldwide, seasonal influenza subtype A viruses accounted for the majority of detections.

In the temperate zone of the Northern hemisphere, influenza activity remained at inter-seasonal levels. In Europe and North America, influenza like illness (ILI) levels started to increase in some countries with low to no influenza virus detections. In Northern Africa, Egypt continued to report low detections of influenza A(H3N2) viruses. In Western Asia, increased influenza A detections were reported in Bahrain and Kuwait (predominantly A(H3N2)). Influenza percent positivity continued to increase in Qatar and Saudi Arabia, with detections of predominately influenza A(H1N1)pdm09 virus. In East Asia, influenza activity remained low in general.

In the Caribbean, influenza detections and respiratory syncytial virus (RSV) detections remained low in general with the exception of Haiti where influenza A(H1N1)pdm09 virus detections remained elevated. In Central American countries, influenza activity was reported in El Salvador and Nicaragua. RSV activity remained elevated in Guatemala, Nicaragua and Panama.

In the tropical countries of South America, influenza and RSV activity were low in most of the countries.

In Western Africa, influenza activity was reported in a number of countries with all seasonal influenza subtypes co-circulating. In Middle Africa, influenza A(H3N2) detections were reported in Cameroon and Central African Republic. In Eastern Africa, increased influenza detections were reported in Kenya and Mauritius.

In Southern Asia, influenza activity of predominantly influenza A(H1N1)pdm09 virus continued to be reported in India. In Nepal, decreased detections of influenza A(H3N2) and B viruses were reported.

In South East Asia, influenza activity continued to be reported in some countries. In Lao PDR, influenza percent positivity remained elevated with influenza A(H1N1)pdm09 predominantly detected. Increased influenza activity was reported in Cambodia and Thailand.

In temperate South America, influenza and RSV activity decreased across the countries of the sub-region.

In Southern Africa, influenza season appeared to have ended in South Africa, with influenza A (H1N1)pdm09 the predominant virus in the first half of the season and influenza B most frequently detected in the second half of the season.

In Oceania, influenza activity returned to approximate inter-seasonal levels. In Australia, influenza season appeared to have ended. In New Zealand, influenza activity declined further in recent weeks and remained below baseline levels.

The WHO GISRS laboratories tested more than 84,313 specimens between 15 October 2018 and 28 October 2018. 2,145 were positive for influenza viruses, of which 1,845 (86.0%) were typed as influenza A and 300 (14.0%) as influenza B. Of the sub-typed influenza A viruses, 905 (64.5%) were influenza A (H1N1)pdm09 and 499 (35.5%) were influenza A (H3N2). Of the characterized B viruses, 54 (52.4%) belonged to the B-Yamagata lineage and 49 (47.6%) to the B-Victoria lineage.

- **Avian Influenza** latest update on 01 November 2018 (WHO website)
Influenza A(H5) viruses
Between 22 September 2018 and 01 November 2018, 2 new laboratory-confirmed human case of influenza A(H5N6) virus infection were reported to WHO from China.

Since 2014 a total of 22 laboratory confirmed cases of human infection with influenza A(H5N6) virus have been reported to WHO from China.

According to reports received by the World Organization for Animal Health (OIE), various influenza A(H5) subtypes continue to be detected in birds in Africa, Europe and Asia.

Influenza A(H7N9)
According to reports from mainland the Hong Kong Special Administrative Region China and those received by the World Organisation for Animal Health (OIE), A(H7N9) avian influenza viruses continue to be detected in China but at lower levels compared to previous years. A nationwide domestic poultry vaccination campaign began in 2017.

- Middle East respiratory syndrome coronavirus (MERS-CoV) latest update on 21 November 2018

Up to 21 November 2018, a total of five cases of Middle East respiratory syndrome coronavirus, MERS-CoV, (three imported and two linked cases) have been confirmed in the UK. On-going surveillance has identified 1,342 suspected cases in the UK that have been investigated for MERS-CoV and tested negative. Between 17 September 2018 and 15 October 2018, the National IHR Focal Point of The Kingdom of Saudi Arabia reported 8 additional cases of Middle East Respiratory Syndrome (MERS), including 3 deaths.

Globally, since September 2012 through to the end of September 2018, WHO has been notified of 2,260 laboratory-confirmed cases of infection with MERS-CoV, including 803 related deaths. Further information on management and guidance of possible cases is available online. The latest ECDC MERS-CoV risk assessment can be found here, where it is highlighted that risk of widespread transmission of MERS-CoV remains very low.

Acknowledgements
This report was prepared by the Influenza section, Immunisations and Countermeasures Division, National Infection Service, Public Health England. We are grateful to all who provided data for this report including the RCGP Research and Surveillance Centre, the PHE Real-time Syndromic Surveillance team, the PHE Respiratory Virus Unit, the PHE Modelling and Statistics unit, the PHE Dept. of Healthcare Associated Infection & Antimicrobial Resistance, PHE regional microbiology laboratories, Office for National Statistics, the Department of Health, Health Protection Scotland, National Public Health Service (Wales), the Public Health Agency Northern Ireland, the Northern Ireland Statistics and Research Agency, QSsurveillance® and EMIS and EMIS practices contributing to the QSsurveillance® database.
