Influenza activity continues to increase, with sporadic cases of influenza detected in the community though all indicators remain Below Baseline threshold levels.

The impact of flu on healthcare services is Below Baseline threshold levels for hospitalisations and at Low intensity levels for ICU/HDU admissions.

Influenza A(H1N1)pdm09 is the dominant subtype

In week 50, no statistically significant excess all-cause mortality by week of death was seen overall and by age group in England. In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed in Scotland, Northern Ireland and Wales.

Over the collection period of the Microbiological surveillance scheme, 5 samples tested positive for influenza (4 influenza A(H1N1)pdm09 and 1 influenza A(unknown subtype)) with a positivity of 10.2% through the UK GP sentinel swabbing schemes.

Severe Respiratory Failure (Severe Acute Respiratory Failure, SARS) was defined by documented radiological evidence of at least one lobe showing non-cardiogenic pulmonary oedema, or the need for mechanical ventilation, or in the case of children, the need for invasive respiratory support.

No cases of Severe Respiratory Failure were reported in week 50. Of the 542 sentinel pneumonia samples submitted, 102 (18.8%) were tested positive for influenza A or B, with 61 (60%) reporting influenza A (49 influenza A(H1N1)pdm09 and 12 influenza A(H3)).

A further 126 (12.2%) tests reported RSV positivity.

In week 51, no cases of Severe Respiratory Failure were reported. In the temperate zone of the Southern hemisphere, influenza activity continued to increase although overall influenza activity remained low. Increased influenza was reported in some countries of Southern and South-East Asia. In the temperate zones of the Southern hemisphere, influenza activity returned to inter-seasonal levels. Worldwide, seasonal influenza subtype A viruses accounted for the majority of detections.
Twenty-eight new acute respiratory outbreaks were reported in the past 7 days.

- Acute respiratory disease outbreaks

Twenty-eight new acute respiratory outbreaks have been reported in the past 7 days. Seventeen outbreaks were reported from care homes where 1 tested positive for influenza A (not subtyped) and 1 was positive for RSV. Four outbreaks were reported from hospitals where 3 tested positive for influenza A (not subtyped) and 1 tested positive for RSV. Seven outbreaks were reported from schools where one tested positive for influenza A (not subtyped).

-Outbreaks should be recorded on HPZone and reported to the local Health Protection Teams and respcidsc@phe.gov.uk

- Medical Officers of Schools Association (MOSA) & PHE surveillance scheme

- Boarding schools in England within the MOSA network are recruited each season to report various respiratory related illnesses including influenza like illnesses (ILI). For the 2018/19 season, 21 MOSA schools have agreed to participate in the scheme, including a total of 6,530 boarders.

- The overall rate (all boarders) for week 49 was 0.9 per 1,000 boarders compared to 0.8 per 1,000 boarders in the previous week.

- Since week 40, there have been 5 outbreaks reported with 12 ILI cases identified. Of the 5 outbreaks, 1 outbreak has tested positive for influenza B.

- If you are a MOSA school and would like to participate in this scheme, please email mosa@phe.gov.uk for more information.

- FluSurvey

- Internet-based surveillance of influenza-like illness in the general population is undertaken through the FluSurvey. A project run by PHE to monitor ILI activity in the community.

- The overall ILI rate (all age groups) for week 50 was 33.0 per 1,000 (972/2,184 people reported at least 1 ILI) (Figure 3) compared to 39.1 per 1,000 in the previous week, with the highest rate seen in the 20-44 year olds (37.9 per 1,000).

- If you would like to become a participant of the FluSurvey project please do so by visiting the https://flusurvey.net/en/accounts/register/ website for more information.
In week 50, the overall weekly influenza-like illness (ILI) GP consultation rate remained below the baseline threshold in England. In the devolved administrations, ILI rates remain below baseline levels.

- **GP ILI consultations in the UK**
  
  **RCGP (England)**
  - The weekly ILI consultation rate through the RCGP surveillance was at 8.1 per 100,000 registered population in participating GP practices in week 50, this is an increase from 7.6 per 100,000 in week 49. This is below the baseline threshold (13.1 per 100,000) (Figure 4). By age group, the highest rates were seen in 15-44 year olds (8.6 per 100,000) and 45-64 year olds (8.5 per 100,000).

  *The Moving Epidemic Method (MEM) has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for GP ILI consultations for the start of influenza activity (based on 10 seasons excluding 2009/10) in a standardised approach across Europe. For MEM intensity threshold values, please visit: [https://www.gov.uk/guidance/sources](https://www.gov.uk/guidance/sources)*
  
  **UK**
  - In week 50, overall weekly ILI consultation rates across the countries of the UK were all below their respective baseline thresholds (Table 1).
  - By age group, the highest rates were seen in the 65-74 year olds in Scotland and Northern Ireland (8.6 per 100,000 and 12.1 per 100,000 respectively) and in the 45-64 year olds in Wales (5.6 per 100,000).

  **Table 1: GP ILI consultations in the UK for all ages with MEM thresholds applied**

  *The Moving Epidemic Method (MEM) has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for GP ILI consultations for the start of influenza activity (based on 10 seasons excluding 2009/10), in a standardised approach across Europe. For MEM threshold values for each country, please visit: [https://www.gov.uk/guidance/sources](https://www.gov.uk/guidance/sources)*

**GP In Hours Syndromic Surveillance System (England)**

- The weekly ILI consultation rate through the GP In Hours Syndromic Surveillance system is at 5.9 per 100,000 in week 50 (Figure 5).
  - During week 50, bronchitis/bronchiolitis continued to decrease in GPOOH and ED attendances. There were also small decreases in ED attendances for respiratory and acute respiratory infections. There were further decreases in NHS 111 cough and difficulty breathing calls, while cold and flu call remained stable. GP consultations for a number of respiratory indicators, including ILI, remain stable with rates at or below expected levels.
  - Figure 5 represents a map of GP ILI consultation rates in week 50 across England by PHE centres, with influenza-like illness surveillance MEM thresholds applied.

  **ILI consultation rates presented for each uTLA on the map should be interpreted in context of regional and national ILI activity; as MEM thresholds are calculated (based on previous influenza seasons from 2012/13 onwards) separately for each of the nine PHE centres and uTLA rates are then compared to Centre-level thresholds only, therefore uTLAs with higher background rates than the Centre may appear to have higher ILI activity.**

  - For further information, please see the syndromic surveillance webpage.
In week 50 2018, there were 77 hospitalised confirmed influenza cases (52 influenza A(H1N1)pdm09, 6 influenza A(H3N2) and 19 influenza A(unknown subtype)) reported through the USISS sentinel hospital network across England (21 NHS Trusts). There were 43 new admissions to ICU/HDU with confirmed influenza (11 influenza A(H1N1)pdm09, 1 influenza A(H3N2), 26 influenza A(unknown subtype) and 5 influenza B) reported through the USISS mandatory ICU/HDU surveillance scheme across the UK (131/143 NHS Trusts in England).

- USISS sentinel weekly hospitalised confirmed influenza cases, England (week 50)
  - In week 50, there were 77 hospitalised laboratory confirmed influenza cases (52 influenza A(H1N1)pdm09, 6 influenza A(H3N2) and 19 influenza A(unknown subtype)) reported from 21 NHS Trusts across England through the USISS sentinel hospital network, with a rate of 0.82 per 100,000 trust catchment population compared to 0.52 per 100,000 in the previous week (Figures 6 and 7). This is below the baseline impact threshold of 0.89 per 100,000.
  - A total of 256 hospitalised confirmed influenza admissions (156 influenza A(H1N1)pdm09, 24 influenza A(H3N2), 59 influenza A(unknown subtype) and 17 influenza B) have been reported in the UK since week 40 2018 via the sentinel scheme.

![Figure 6: Weekly hospitalised influenza case rate per 100,000 trust catchment population, England, since week 40 2018](image)

*The Moving Epidemic Method (MEM) has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for ICU/HDU admission rates for the start of influenza activity (based on 6 seasons) in a standardised approach across Europe. For MEM threshold values, please visit: https://www.gov.uk/guidance/sources*

- Number of new admissions and fatal confirmed influenza cases in ICU/HDU (USISS mandatory ICU scheme), UK (week 50)
  - In week 50, there were 43 new admissions to ICU/HDU with confirmed influenza (11 influenza A(H1N1)pdm09, 1 influenza A(H3N2), 26 influenza A(unknown subtype) and 5 influenza B) reported across the UK (131/143 Trusts in England) through the USISS mandatory ICU scheme. The rate for England (n=43) was 0.09 per 100,000 trust catchment population compared to 0.07 per 100,000 in the previous week (Figures 8 and 9), breaching the baseline impact threshold of 0.09 per 100,000. Five influenza laboratory-confirmed deaths were reported to have occurred in ICU in week 50 in the UK.
  - A total of 169 new ICU/HDU admissions (64 influenza A(H1N1)pdm09, 4 influenza A(H3N2), 92 influenza A(unknown subtype) and 9 influenza B) and 11 confirmed deaths have been reported in the UK since week 40 2018.

![Figure 8: Weekly ICU/HDU influenza admission rate per 100,000 trust catchment population, England, since week 40 2018](image)

*The Moving Epidemic Method (MEM) has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for ICU/HDU admission rates for the start of influenza activity (based on 6 seasons) in a standardised approach across Europe. For MEM threshold values, please visit:
- **USISS Severe Respiratory Failure Centre** confirmed influenza admissions, UK (week 50)
  - In week 50, there was 1 new admission for laboratory confirmed influenza (1 influenza A(H1N1)pdm09) among the 6 Severe Respiratory Failure (SRF) centres in the UK.
  - Since week 40 there has been 3 confirmed influenza admissions (2 influenza A(H1N1)pdm09 and 1 influenza A(unknown subtype)) to ECMO centres

### All-cause mortality data

In week 50 2018, no statistically significant excess all-cause mortality by week of death was observed overall and by age group in England, through the EuroMOMO algorithm. In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed in Scotland, Wales and Northern Ireland in week 50 2018.

- **All-cause death registrations, England and Wales**
  - In week 49 2018, an estimated 10,287 all-cause deaths were registered in England and Wales (source: Office for National Statistics). This is an increase compared to the 10,033 estimated death registrations in week 48 2018.

- **Excess all-cause mortality by age group, England, Wales, Scotland and Northern Ireland**
  - In week 50 2018 in England, no statistically significant excess mortality by week of death above the upper 2 z-score threshold was seen overall, by age group and sub-nationally (all ages), after correcting ONS disaggregate data for reporting delay with the standardised EuroMOMO algorithm. This data is provisional due to the time delay in registration; numbers may vary from week to week.
  - In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed in Scotland, Wales and Northern Ireland in week 50 2018 (Table 2).

### Table 2: Excess mortality by UK country, for all ages*

<table>

*Excess mortality is calculated as the observed minus the expected number of deaths in weeks above threshold

*NA refers to data not available for this week

*Note: Delays in receiving all registered deaths from April 2018, following changes in IT systems at ONS, may result in some delays in the model to adjust for most recent deaths.

---

**Figure 10**: Weekly observed and expected number of all-age all-cause deaths, with the dominant circulating influenza A subtype, England, 2014 to week 50 2018

*Note: Delays in receiving all registered deaths from April 2018, following changes in IT systems at ONS, may result in some delays in the model to adjust for most recent deaths.
In week 50 2018, 5 samples tested positive for influenza (4 influenza A(H1N1)pdm09 and 1 influenza A(unknown subtype)) with a positivity of 10.2% through the UK GP sentinel schemes. 135 positive detections were recorded through the DataMart scheme (79 influenza A(H1N1)pdm09, 15 influenza A(H3), 38 influenza A(unknown subtype) and 3 influenza B) with a positivity of 7.0%, this is below the baseline threshold of 9.2%.

- Sentinel swabbing schemes in England (RCGP) and the Devolved Administrations
  - In week 50, 5 samples tested positive for influenza (4 influenza A(H1N1)pdm09 and 1 influenza A(unknown subtype)) with an overall positivity of 10.2% compared to 3.8% in week 49 through the UK GP sentinel swabbing schemes (Figure 11).

Since week 40, a total of 33 samples (22 influenza A(H1N1)pdm09, 5 influenza A(H3), 4 influenza A(unknown subtype) and 2 influenza B) tested positive for influenza through this scheme.

- Respiratory DataMart System (England)
  - In week 50 2018, out of the 1,936 respiratory specimens reported through the Respiratory DataMart System, 135 samples (7.0%) were positive for influenza (79 influenza A(H1N1)pdm09, 15 influenza A(H3), 38 influenza A(unknown subtype) and 3 influenza B) (Figure 12), which is below the MEM baseline threshold for this season of 9.2%. The highest positivity for influenza by age group was seen in the 15-44 year olds at 11.2% in week 50 (Figure 13). The overall positivity for RSV decreased further from 19.5% in week 49 to 15.5% week 50 (Figure 14). Although the main affected population is in children <5 years the positivity also decreased in this group from 44.9% in week 49 to 31.0% in week 50.

Parainfluenza positivity decreased slightly from 3.3% in week 49 to 2.1% in week 50. Rhinovirus remained stable in week 50 at 12.8%. Human metapneumovirus (hMPV) positivity, although low, increased slightly to 2.8% in week 50 from 2.5% in week 49. Adenovirus positivity remained low and stabilised at 3.0% (Figure 14).

*The Moving Epidemic Method has been adopted by the European Centre for Disease Prevention and Control to calculate thresholds for GP ILI consultations for the start of influenza activity in a standardised approach across Europe. The threshold to indicate a likelihood of influenza community circulation for Datamart % positive as calculated through the Moving Epidemic Method is 9.2% in 2018/19.*
- **Virus characterisation**

PHE characterises the properties of influenza viruses through one or more tests, including **genome sequencing** (genetic analysis) and **haemagglutination inhibition (HI) assays** (antigenic analysis). These data are used to compare how similar the currently circulating influenza viruses are to the strains included in seasonal influenza vaccines, and to monitor for changes in circulating influenza viruses. The interpretation of genetic and antigenic data sources is complex due to a number of factors, for example, not all viruses can be cultivated in sufficient quantity for antigenic characterisation, so that viruses with sequence information may not be able to be antigenically characterised as well. Occasionally, this can lead to a biased view of the properties of circulating viruses, as the viruses which can be recovered and analysed antigenically, may not be fully representative of majority variants, and genetic characterisation data does not always predict the antigenic characterisation.

Genetic characterisation by the PHE Respiratory Virus Unit of 19 influenza A(H1N1)pdm09 viruses detected since week 40, shows that they all belong in the genetic subgroup 6B.1, which was the predominant genetic subgroup in the 2017/18 season. Fifty A(H1N1)pdm09 viruses have been antigenically characterised and are similar to the A/Michigan/45/2015-like Northern Hemisphere 2018/19 (H1N1)pdm09 vaccine strain.

The PHE Respiratory Virus Unit has characterised 15 influenza A(H3N2) viruses detected since week 40. Genetic characterisation of these A(H3N2) viruses shows that they belong to genetic subclade 3C.2a1. The Northern Hemisphere 2018/19 influenza A(H3N2) vaccine strain belongs in genetic subclade 3C.2a1.

Of two influenza B viruses characterised to date, one influenza B virus has been characterised where sequencing of the haemagglutinin (HA) gene shows it belongs within genetic clade 1A of the B/Victoria lineage, in a subgroup characterised by deletion of two amino acids in the HA. The N.Hemisphere 2018/19 B/Victoria-lineage quadrivalent and trivalent vaccine component virus (a B/Colorado/06/2017-like virus), is a double deletion subgroup virus. The other influenza B virus has been characterised as antigenically similar to the B/Phuket/3073/2013 B/Yamagata lineage vaccine component in the N.Hemisphere 2018/19 quadrivalent vaccine.

- **Antiviral susceptibility**

Influenza positive samples are screened for mutations in the virus neuraminidase gene known to confer oseltamivir and/or zanamivir resistance. Additionally, testing of influenza A(H1N1)pdm09, A(H3N2), and influenza B virus isolates for neuraminidase inhibitor susceptibility (oseltamivir and zanamivir) is performed at PHE-RVU using a functional assay. The data summarized below combine the results of both testing methods. The samples tested are routinely obtained for surveillance purposes, but diagnostic testing of patients suspected to be infected with neuraminidase inhibitor-resistant virus is also performed.

During the current 2018/19 season since week 40 2018, 29 influenza A(H1N1)pdm09 viruses have been tested for oseltamivir susceptibility and all but two were fully susceptible. The resistant cases each had an H275Y mutation. 22 out of the 29 influenza A(H1N1)pdm09 virus have also been tested for zanamivir susceptibility and all but two were fully susceptible.

14 influenza A(H3N2) viruses have also been tested for oseltamivir susceptibility and 13 of 14 influenza A(H3N2) viruses tested for zanamivir, all samples were susceptible to both agents.

One influenza B was tested for both oseltamivir and zanamivir and was susceptible to both agents.

- **Antimicrobial susceptibility**

-Table 4 shows in the 12 weeks up to 16 December 2018, the proportion of all lower respiratory tract isolates of *Streptococcus pneumoniae*, *Haemophilus influenzae*, *Staphylococcus aureus*, MRSA and MSSA tested and susceptible to antibiotics. These organisms are the key causes of community acquired pneumonia (CAP) and the choice of antibiotics reflects the British Thoracic Society empirical guidelines for management of CAP in adults.

*Macrolides = erythromycin, azithromycin and clarithromycin*
- Up to week 50 2018, in 96.7% of GP practices reporting weekly to Immmform, the provisional proportion of people in England who had received the 2018/19 influenza vaccine in targeted groups was as follows (Figure 15):
  - 43.4% in under 65 years in a clinical risk group
  - 42.8% in pregnant women
  - 68.6% in 65+ year olds

- In 2018/19, all 2 and 3 year-olds continue to be eligible for flu vaccination, through their GPs. Up to week 50 2018, in 97.1% of GP practices reporting weekly to ImmmForm, the provisional proportion of children in England who had received the 2018/19 influenza vaccine in targeted groups was as follows (Figure 16):
  - 40.5% in 2 year olds
  - 41.7% in 3 year olds

- Provisional data from the first monthly collection of the influenza vaccine uptake by frontline healthcare workers show 61.0% were vaccinated by 30 November 2018 from 97.9% of all organisations, compared to 59.3% vaccinated in the previous season by 30 November 2017. The report provides uptake at national, NHS England local team and Trust-level.
• Provisional data from the first monthly collection of influenza vaccine uptake for children of school years Reception, 1, 2, 3, 4 and 5 age (from a sample of 100% of all Local Authorities in England) show the provisional proportion of children in England who received the 2018/19 influenza vaccine via school, pharmacy or GP practice by 31 October 2018 in targeted groups as follows:
  o 20.5% in children school year reception age (4-5 yrs)
  o 20.7% in children school year 1 age (5-6 yrs)
  o 19.9% in children school year 2 age (6-7 yrs)
  o 19.7% in children school year 3 age (7-8 yrs)
  o 18.9% in children school year 4 age (8-9 yrs)
  o 18.2% in children school year 5 age (9-10 yrs)

### International Situation

In the temperate zone of the Northern hemisphere, influenza activity continued to increase although overall influenza activity remained low. Increased influenza was reported in some countries of Southern and South-East Asia. In the temperate zones of the Southern hemisphere, influenza activity returned to inter-seasonal levels. Worldwide, seasonal influenza subtype A viruses accounted for the majority of detections

• **Europe** updated on 14 December 2018 (Joint ECDC-WHO Europe Influenza weekly update)

Although some countries are starting to see local and regional spread, influenza activity remained at baseline or was low throughout the European Region. Of all the Member States and areas with influenza-like illness thresholds defined, only Italy and Poland reported activity above their baseline levels. Of 51 Member States and areas reporting on intensity, 15 reported baseline, 32 reported low (across the region) and 4 reported medium intensity (Georgia, Kyrgyzstan, Malta and Ukraine) for week 49.

Of the 51 Member States reporting on geographic spread, 16 reported no activity, 26 reported sporadic cases, 4 reported local (France, Italy, Latvia and Portugal), 3 reported regional (Israel, Sweden and Ukraine) and 2 reported widespread activity (Georgia and Turkey).

For week 49, 154 (13%) of the 1,189 sentinel specimens tested positive for influenza viruses, 151 (98.1%) were influenza A and 3 (1.9%) were type B. Of the 135 type A viruses subtyped, 76 (56.3%) were influenza A(H1N1)pdm09 and 59 (43.7%) were influenza A(H3N2).

For week 49, 45 laboratory-confirmed influenza cases were reported in ICUs, 152 (93.8%) influenza type A and 13 (8.3%) influenza type B viruses were detected. Of the 75 subtyped viruses 90.7 were A(H1N1)pdm09 and 9.3% were A(H3N2). No influenza B viruses were ascribed to a lineage. Among the 33 laboratory confirmed influenza cases in other wards reported 31 were infected with influenza type A virus infection and 2 were infected with influenza type B viruses.

For week 49, 809 specimens from non-sentinel sources (such as hospitals, schools, primary care facilities not involved in sentinel surveillance, or nursing homes and other institutions) tested positive for influenza viruses. Of the 809, 783 (96.8%) were type A and 2.6 (3.2%) were type B viruses. Of the 228 influenza A viruses that were subtyped, 138 (60.5%) were A(H1N1)pdm09 and 90 (39.5%) were A(H3N2). None of the influenza B viruses were assigned to a lineage.

For week 49, data from the 20 Member States or areas reporting to the EuroMOMO project indicated all-cause mortality to be at expected levels for this time of year.

• **United States of America** updated on 14 December 2018 (Centre for Disease Control report)

During week 49, influenza activity in the United States remained slightly elevated.

Influenza A and B viruses continue to co-circulate with influenza A(H1N1)pdm09 most commonly reported by public health laboratories.

A cumulative rate of 1.9 laboratory-confirmed influenza-associated hospitalisations per 100,000 population was reported.

Nationwide during week 49, the proportion of outpatient visits for influenza-like illness (ILI) remained at 2.2%, which is at the national baseline of 2.2%.

For week 48, the proportion of deaths attributed to pneumonia and influenza (P&I) was 6.0%, below the epidemic threshold (6.6%) in the National Center for Health Statistics (NCHS) Mortality Surveillance System. One influenza-associated pediatric death (influenza B) was reported to the CDC during week 49.
• **Canada** updated on 14 December 2018 (Public Health Agency report)

Overall, influenza activity continued to increase in week 49. Influenza A is the most common influenza virus circulating predominantly influenza A(H1N1)pdm09.

In week 49, a total of 1,500 laboratory confirmed detections of influenza were reported, of which 99% were influenza A. The percentage of tests positive for influenza from sentinel laboratories continued to increase to 19.3%, which is above the seasonal threshold of 5.0%.

In week 49, 2.1% of visits to healthcare professionals were due to ILI, the percentage of visits for ILI is within expected levels.

To date this season, 705 influenza-associated hospitalisations have been reported by participating provinces and territories, of which 702 (99%) were associated with influenza A. To date this season, 90 ICU admissions and 16 deaths have been reported.

• **Global influenza update** updated on 10 December 2018 (WHO website)

In the temperate zone of the Northern hemisphere, influenza activity continued to increase although overall influenza activity remained low. Increased influenza was reported in some countries of Southern and South-East Asia. In the temperate zones of the Southern hemisphere, influenza activity returned to inter-seasonal levels. Worldwide, seasonal influenza subtype A viruses accounted for the majority of detections.

In North America, influenza activity increased slightly overall, with influenza A(H1N1)pdm09 as the dominant subtype. In Canada, paediatric hospitalisations were high for this time of year mainly due to influenza A(H1N1)pdm09 virus. In the United States, influenza activity remained low, with influenza A subtypes co-circulating. Influenza-like illness (ILI) activity increased crossing the seasonal threshold.

In Europe and Central Asia, influenza activity started to increase in some countries but remained low in general, with detection of influenza A(H1N1)pdm09, A(H3N2) and influenza B viruses.

In North Africa, Egypt continued to report low detected across reporting countries.

In Western Asia, respiratory illness indicators increased in some of the countries although low to no influenza was detected. Influenza activity remained elevated across countries of the Arabian Peninsula.

In East Asia, respiratory illness indicators and influenza activity remained low in general. ILI levels were reported above the seasonal threshold in Republic of Korea.

In the Caribbean, influenza and respiratory syncytial virus (RSV) detections remained low in general. In Haiti, influenza A(H1N1)pdm09 virus were reported as decreased. In Central American countries, influenza activity appeared to decline in Costa Rica, El Salvador and Nicaragua with influenza A(H1N1)pdm09, A(H3N2) and influenza B viruses co-circulating.

In the tropical countries of South America, influenza and RSV activity were low in general.

In Western Africa, influenza activity from reporting countries was due to a mixture of influenza B (Victoria-lineage predominantly) and influenza A (both subtypes). In Middle Africa, ILI activity and detections of influenza A(H3N2) and influenza B viruses (both lineages) increased in Cameroon. In Eastern Africa, influenza detections of predominantly influenza A(H3N2) and A(H1N1)pdm09 viruses were reported in Kenya and Mauritius, respectively. Influenza B virus detection were reported Mozambique.

In Southern Asia, India continued to report influenza activity of predominantly influenza A(H1N1)pdm09 virus. Influenza activity continued to increase in Iran with influenza A(H3N2) viruses most frequently detected.

In South-East Asia, influenza activity continued to be reported in some countries. In Lao PDR, influenza percent positivity remained elevated with influenza A(H1N1)pdm09 virus most frequently detected. Although decreased, influenza activity continues to be reported in Cambodia and Thailand with influenza B and influenza A(H1N1)pdm09 predominating respectively.
Influenza A(H5) viruses
Between 2 November 2018 and 13 December 2018, no new laboratory-confirmed human cases of influenza A(H5) virus infections were reported to WHO.

According to reports received by the World Organization for Animal Health (OIE), various influenza A(H5) subtypes continue to be detected in birds in Africa, Europe and Asia.

Influenza A(H7N2)
Between 2 November 2018 and 13 December 2018, 1 additional laboratory-confirmed human case of infection with an avian influenza A(H7N2) virus, associated with an outbreak in cats in the USA. This is the second human case of infection with influenza A(H7N2) virus transmitted from cats to humans.

Influenza A(H7N9)
According to reports from mainland China and the Hong Kong Special Administrative Region China and those received by the World Organisation for Animal Health (OIE), A(H7N9) avian influenza viruses continue to be detected in China but at lower levels compared to previous years. A nationwide domestic poultry vaccination campaign began in 2017.

Influenza A(H9N2)
Between 2 November 2018 and 13 December 2018, 2 new laboratory-confirmed cases of influenza A(H9N2) virus infections were reported to WHO from China. Avian influenza A(H9N2) viruses are enzootic in poultry in China.

• **Middle East respiratory syndrome coronavirus (MERS-CoV)** latest update on 19 December 2018

Up to 19 December 2018, a total of five cases of Middle East respiratory syndrome coronavirus, MERS-CoV, (three imported and two linked cases) have been confirmed in the UK. Ongoing surveillance has identified 1,379 suspected cases in the UK that have been investigated for MERS-CoV and tested negative.

Between 16 October 2018 and 30 October 2018, the National IHR Focal Point of The Kingdom of Saudi Arabia reported 4 additional cases of Middle East Respiratory Syndrome (MERS), including 1 death.

Globally, since September 2012 through to the end of October 2018, WHO has been notified of 2,266 laboratory-confirmed cases of infection with MERS-CoV, including 804 related deaths. Further information on management and guidance of possible cases is available online. The latest ECDC MERS-CoV risk assessment can be found here, where it is highlighted that risk of widespread transmission of MERS-CoV remains very low.

Acknowledgements

This report was prepared by the Influenza section, Immunisations and Countermeasures Division, National Infection Service, Public Health England. We are grateful to all who provided data for this report including the RCGP Research and Surveillance Centre, the PHE Real-time Syndromic Surveillance team, the PHE Respiratory Virus Unit, the PHE Modelling and Statistics unit, the PHE Dept. of Healthcare Associated Infection & Antimicrobial Resistance, PHE regional microbiology laboratories, Office for National Statistics, the Department of Health, Health Protection Scotland, National Public Health Service (Wales), the Public Health Agency Northern Ireland, the Northern Ireland Statistics and Research Agency, QSurveillance® and EMIS and EMIS practices contributing to the QSurveillance® database.
