## **Isles of Scilly MCZ**

### **Feature Maps**

**May 2019**

The following maps show where the features protected by this Marine Conservation Zone (MCZ) are located.

There are twelve separate maps, to make it easier to see the locations of features. The maps show the broad-scale habitats and features of conservation importance. Broad scale habitats represent habitats, and associated species that live on and in the habitat. Features of conservation importance are specific habitats and species that are known to be rare, threatened or declining in our seas.

A range of different types of surveys have been used to create these maps. The symbols on the map show where a sample has been taken, or where a feature has been recorded in a specific location. For many features, there is also shading to show the extent of the area in which the feature is found. For the broad scale habitat maps, this is created from survey data and using mathematical models. On the FOCI maps, the extent is only shown where a survey has confirmed that the feature exists in this whole area. More detailed information on the techniques used and the features themselves can be found here:
