PHE National Influenza Report
Summary of UK surveillance of influenza and other seasonal respiratory illnesses
18 July 2019 – Week 29 report (up to week 28 data)

Indicators for influenza show low levels of activity.

Community surveillance
- GP consultation rates for influenza-like illness (ILI) remain low in all schemes in the UK (Table 1 & Figure 1).

Table 1: GP ILI consultations for all ages – week 27-28 2019, UK

*data not available

- Syndromic surveillance
  - Syndromic surveillance indicators for influenza remained low, in weeks 27 and 28 2019.
  - For further information, please see the Syndromic surveillance webpage.

Virological surveillance
- English Respiratory DataMart system
  - In week 28 2019, 13 (1.1%) of the 1,165 respiratory specimens tested were positive for influenza (7 influenza A(H3), 5 influenza A(not subtyped) and one influenza B).
  - RSV positivity remained low (<1%).
  - Rhinovirus and adenovirus positivity increased at 17.0% and 5.9% respectively, in week 28.
  - Parainfluenza positivity decreased slightly to 3.4% in week 28.
  - Human metapneumovirus (hMPV) positivity remained low at 1.5% in week 28.

Outbreak Reporting
- Fourteen new acute respiratory outbreaks have been reported in the past two weeks. Twelve outbreaks were reported from care homes where one tested positive for parainfluenza and one other tested positive for picornavirus. One outbreak was reported from a hospital with no test results available. The remaining outbreak was reported from the Other settings category with no test results available. Outbreaks should be reported to the local Health Protection Team and Respсидsc@phe.gov.uk.
**All-cause mortality surveillance**

- In week 28 2019, no significant excess was reported overall, by age group or by region in England after correcting ONS dis-aggregate data for reporting delay with the standardised weekly EuroMOMO algorithm (Table 2). This data is provisional due to the time delay in registration and so numbers may vary from week to week.

**Figure 3: Weekly observed and expected number of all-cause deaths in all ages, with the dominant circulating influenza A subtype, England, 2014 to week 28 2019**

*Excess mortality is calculated as the observed minus the expected number of deaths in weeks above threshold*

*All refers to no excess seen

---

**International Surveillance**

- **Influenza updated on 08 July 2019**
  - In the temperate zone of the Southern hemisphere, influenza activity continued to increase and the influenza season appeared to have started earlier than previous years in Australia, Chile, South Africa and New Zealand. Overall the majority of detections accounted for seasonal influenza A viruses. In the temperate zone of the northern hemisphere influenza activity returned to inter-seasonal level in most countries.
  - In Oceania, influenza activity continued to be elevated across the continent, with influenza A(H3N2) being the dominant subtyped virus. In Australia, influenza like illness (ILI) and influenza activity remained elevated, and was seemingly plateauing after an early start of the season. At national level, weekly laboratory-confirmed notifications of influenza further increased, and the percent positivity increased in some states while it started to decrease in some others. Influenza activity continued to increase in New Zealand, with influenza B (Victoria-lineage) viruses being predominant. Increased detections of Influenza B have been reported in Fiji and Wallis & Futuna.
  - In South Africa, influenza activity continued to increase with influenza A(H3N2) viruses predominating.
  - In South America, overall influenza activity was increased throughout the sub-region. Brazil reported increased influenza activity with influenza A(H3N2) predominating. Chile reported elevated activity with co-circulation of influenza A(H1N1)pdm09, influenza A(H3N2) and influenza B viruses.
  - In the Caribbean, Central American countries and the tropical countries of South America, influenza activity remained low overall. In Western and Middle Africa, influenza detections were low across reporting countries.
  - In Eastern Africa, influenza detections continued to be reported with influenza A(H1N1)pdm09 predominating, followed by A(H3N2).
  - In Southern Asia and in South East Asia, influenza activity was low overall with influenza A(H1N1)pdm09 and B viruses predominating.
  - The WHO GISRS laboratories tested more than 68,851 specimens between 10 June 2019 and 23 June 2019. 6,853 were positive for influenza viruses, of which 4,387 (64.0%) were typed as influenza A and 2,466 (36.0%) as influenza B. Of the sub-typed influenza A viruses, 972 (36.1%) were influenza A(H1N1)pdm09 and 1,717 (63.9%) were influenza A(H3N2). Of the characterized B viruses, 48 (4.0%) belonged to the B-Yamagata lineage and 1,144 (96.0%) to the B-Victoria lineage.

- **MERS-CoV updated on 17 July 2019**
  - Since September 2012 up to 17 July 2019, a total of five cases of Middle East respiratory syndrome coronavirus, MERS-CoV, (three imported and two linked cases) have been confirmed in the UK. On-going surveillance has identified 1,541 suspected cases in the UK that have been investigated for MERS-CoV and tested negative.
  - From 09 April to 30 April 2019, the National IHR Focal Point of Saudi Arabia reported 9 additional cases of Middle East respiratory syndrome coronavirus (MERS-CoV) infection, including 3 deaths. Of the 9 MERS-CoV cases reported, 5 cases were associated with ongoing clusters in 3 cities.
  - Globally, since September 2012, WHO has been notified of 2,428 laboratory-confirmed cases of infection with MERS-CoV, including at least 838 related deaths. Further guidance on the management of possible cases in the UK is available online. The latest ECDC MERS-CoV risk assessment can be found here, where it is highlighted that widespread risk of transmission of MERS-CoV remains very low.

- **Avian influenza** updated on 24 June 2019
  - Between 11 May to 24 June 2019, one new laboratory-confirmed human case of influenza A(H1N1)v virus infection was reported from the United States of America. During the same period, no new laboratory-confirmed human case of influenza A(H5) or A(H7N9) virus infections have been reported to WHO.
  - For further updates please see the WHO website and for advice on clinical management in the UK please see information available online.
