Annex B - Hazardous Area Drawings        B1 – B4
Annex C - Supporting Records / Documents C1 – C2
Annex D - Potential DSEAR Related Facilities and Processes / Activities D1

Introduction

1. The Dangerous Substances and Explosive Atmospheres Regulations (DSEAR) require the MOD to assess the risk of harm to personnel from fires or explosions involving dangerous substances in the workplace. These risks must be eliminated or reduced so far as is reasonably practicable. The aim is to both prevent harm to Defence personnel, contractors, visitors and members of the public who may be put at risk, and to minimise collateral damage.

2. The Regulations complement the requirement to manage risks under the Management of Health and Safety at Work Regulations and transpose two European Directives (the Chemical Agents Directive (98 / 24 / EC) and the Explosive Atmospheres Directive (99 / 92 / EC)) into UK legislation. They also replace older regulations dealing with flammable substances safety.

3. DSEAR deals with the immediate danger to life or health from fires or explosions resulting from the ignition of dangerous substances and should not be confused with COSHH which deals with the chronic and acute health effects of exposure to substances hazardous to health. Processes and the storage involving dangerous substances that require a DSEAR assessment will also require COSHH assessments.

4. The manufacture, handling, use, storage and transport of explosives is not covered in this chapter, these requirements are covered in specific Joint Service Publications (JSPs) and Defence Regulations (DSA02).
Roles and Responsibilities

Procurement or Acquisition

5. As 'suppliers' or 'importers', Design Authorities, project teams (persons responsible for procurement and delivery of equipment and services) Maintenance Management Organisations (MMO) and Defence acquisition teams have the responsibility to ensure that equipment and infrastructure procured, operated or maintained (in accordance with EN 60079-17:2007) is safe to use. Analysis of explosion protection and consideration of prevention or control measures must be carried out at an early stage by, or in conjunction with, the manufacturer / supplier who should have the required competences. The explosion protection analysis must include the identification and calculation of DSEAR zones and equipment category requirements, along with any necessary design alterations. Design risk assessments should be obtained from suppliers in accordance with the Construction (Design and Management) Regulations 2015.

6. Organisations / persons responsible for the procurement or maintenance of plant, equipment and / or facilities which involve hazardous substances must ensure that relevant information is provided to the operating authority for inclusion in the Stage 2 DSEAR risk assessments. This will include, but is not limited to, hazard analysis, Hazardous Area Classification Drawings, ratings of equipment etc, Material Safety Data Sheets (MSDS) and information on required / recommended control measures.

7. DSEAR risk assessments provided by manufacturers or suppliers may not relate to the specific circumstances (use and location) in which the equipment will be used by the MOD; therefore, a DSEAR risk assessment which considers the factors relating to MOD use must be completed. Site grab packs should be updated along with any relevant site risk matrix. Information should be readily available to the Emergency Services in the event of an emergency on site.

Infrastructure Provider

8. The responsibility to provide a legal and Defence DSEAR compliant infrastructure rests with the individual with the direct authority to commit adequate resources for maintaining the infrastructure and associated site plans, building / facility drawings, fixed signage, etc. The infrastructure provider must provide the Commanding Officer / Head of Establishment (CO / HoE) with assurance that the correct category of fixed assets / electrical systems is maintained and is compliant with the hazardous area classification in accordance with the appropriate DSEAR risk assessment. Maintenance schedules should be adhered to and reactive maintenance recorded and tracked.

Commanding Officer / Head of Establishment

9. The CO / HoE owns the risk and the responsibility to ensure that all areas where explosive atmospheres are likely to be present are identified, assessed and controlled in accordance with DSEAR. This includes ensuring that Stage 1 and 2 DSEAR risk assessments are conducted; establishing hazardous area zones; and providing information to the infrastructure provider to allow drawings to be updated; and signs to be moved / erected etc. The CO / HoE should appoint a Hazardous
Area Manager (where appropriate) to co-ordinate this function and monitor compliance.

10. Where the MOD shares the workplace with a lodger organisation, contractor or private individual / organisation; arrangements must be put in place to co-ordinate the implementation of the protective measures identified by the DSEAR risk assessment. Noting that overall responsibility rests with the HoE, other Chapters\(^1\) and DSA02 Regulations refer.

11. Known and suspected DSEAR activities / processes must be Stage 1 DSEAR risk assessed (MOD Form 5014) by competent persons as detailed in paragraph 34 to identify whether the process / activity produces an explosive atmosphere and if a Stage 2 DSEAR risk assessment is required. Where the need has been identified, the CO / HoE must ensure that competent persons are formally appointed to undertake a comprehensive DSEAR risk assessment and determine the correct classification and boundaries of DSEAR hazardous area zones. Additional SME advice may be required; this may be provided by the TLB safety organisation or the process operator etc.

12. Before any facility / workplace that has been classified as a hazardous area under DSEAR is used for the first time, the CO / HoE must seek assurance from a suitably qualified person that the requirements of this chapter have been met.

13. All DSEAR risk assessments and control measures relating to process fire precautions are to be brought to the attention of the fire safety risk assessor(s) to allow the impact on the wider general fire precautions for the unit / establishment to be evaluated and to ensure compliance with fire safety legislation.

**Managers**

14. The manager of any DSEAR activity / process / area is to ensure that; a current DSEAR risk assessment is available, the activity / process / area and procedures are maintained to ensure compliance and that all personnel are trained and competent.

15. Managers are to ensure that Safe Systems of Work are in place to prevent the accidental release of a substance and prevent the presence of potential ignition sources within zoned areas. All Defence personnel, contractors and visitors proposing to enter an identified hazardous area must be provided with relevant information, instructions and training in accordance with the requirements of JSP 375 Volume 1, Chapter 34; which shall include:

   a. the dangerous substances present in the workplace and the risks they present including access to any relevant Safety Data Sheets and information on any other legislation that applies to the dangerous substance;

   b. the findings of the risk assessment and the control measures implemented as a result (including their purpose and how to follow and use them);

---

\(^1\) JSP 375 Volume 1, Chapter 2 (Office and General Workplace Safety) and Chapter 34 (4C System: The Management of Visiting Workers and Contractors). See DSA02-DOSR-MACR and DSA-2-DLSR-FGSR, other DSA02 may apply.
emergency / rescue procedures should be implemented; and

d. the control of contraband items (smoking materials, mobile phones, radios, MP3 players etc).

16. Appropriate work clothing and tools minimising the risk of electrostatic discharges that could ignite an explosive atmosphere are to be provided. The provision of PPE may also be required under COSHH / REACH for occupational health and safety protection\(^2\). The manager must put in place checks to ensure these are maintained and used when working in hazard zones. Routine checks on the effective control of contraband and other control measures identified by the Stage 2 DSEAR risk assessments must be conducted by managers.

17. Managers responsible for maintenance operations are to ensure that an appropriate task risk assessment has been undertaken, including any additional measures necessary to ensure the safety of personnel; and that only competent personnel who are aware of the additional hazards and control measures undertake such work in the DSEAR zoned area. Maintenance activities shall be conducted under a “permit to work” system (in accordance with JSP 375 Volume 1, Chapter 30, JSP 375 Volume 3 or specified Safety Case).

All Personnel

18. Personnel are to comply with the requirements of the DSEAR risk assessment, Safe Systems of Work, and the correct use of control measures. All personnel must undertake such training as is required to enable them to understand and comply with all instructions provided.

Dangerous Substances

19. Dangerous substances in the context of DSEAR are substances or mixtures of substances (referred to as “preparations” in DSEAR) that could create risks to personnel safety from fires and explosions or similar events, such as ‘thermal runaway’ from chemical reactions (exothermic reactions).

20. Liquids, gases, vapours and dusts that may be found in a workplace can all be dangerous substances; these include:

a. substances or mixtures of substances classified as explosive, oxidising, extremely flammable, highly flammable, or flammable under the Classification, Labelling and Packaging of Substances and Mixtures Regulation (CLP);

b. dust, gases or vapours that when airborne may form a potentially explosive cloud (solvents, paints, varnishes, flammable gases - such as liquid petroleum gas (LPG), metal and wood dusts from machining and sanding operations and dusts from foodstuffs such as flour etc);

c. any other substances, or mixtures of substances which, because of their physical properties, and the way in which they are present in the workplace,

\(^2\) See Chapter 15 - PPE, Chapter 31 - Hot work and Chapter 39 - Retention of Records
create a risk to safety from fires and explosions, but which may not be covered by CLP; and

d. materials which would not normally be regarded as hazardous but may become so when pumped or stored / used under pressure and which could generate a flammable mist on release.

21. Substances (such as diesel) with a high flashpoint shall not normally require zoning (except inside bulk storage tanks) unless the substance is under pressure with the potential of forming a mist or spray capable of creating an explosive atmosphere (this may be due to failure of the high-pressure systems in which they are handled). Zoning is required where the temperature is close to the flashpoint of the substance, typically where the temperature is within approximately 10°C of the flashpoint although the exact figure will depend on the circumstances and process.

Hazard Zones

22. The identification of facilities (pipes, tanks etc.), activities, areas (refuelling points, pits, trenches etc.) and buildings within the workplace where explosive atmospheres may occur must be recorded in the site risk assessment (JSP 375 Volume 1, Chapter 8) and the 4C Area Hazard Register (JSP 375 Volume 1, Chapter 34), and be classified as hazardous (a place in which an explosive atmosphere may occur in such quantities as to require special precautions to protect the health and safety of the workers).

23. Hazardous places are classified in terms of zones based on the frequency and duration of the occurrence of an explosive atmosphere. Hazardous places must be marked with signs (fig.1) at entry points to hazardous zones (unless alternative signage has already been provided under other legislation that is considered sufficient to warn of an explosive atmosphere) along with any other hazard signs / information identified in the Stage 2 DSEAR risk assessments (e.g. ‘Ex’ signs need not normally be displayed and petroleum filling stations where there are already sufficient signs displayed to warn of the potential hazards). The classification of Zones are as follows:

a. for gas, vapour or mist:

(1) Zone 0 - a place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is present continuously or for long periods or frequently;

(2) Zone 1 - a place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is likely to occur in normal operation occasionally; and

(3) Zone 2 - a place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if it does occur, will persist for a short period only.

See Chapter 29 - Pressure Vessels
b. for combustible dust:

(1) Zone 20 - a place in which an explosive atmosphere in the form of a cloud of combustible dust in air is present continuously, or for long periods or frequently;

(2) Zone 21 - a place in which an explosive atmosphere in the form of a cloud of combustible dust in air is likely to occur in normal operations occasionally; and

(3) Zone 22 - a place in which an explosive atmosphere in the form of a cloud of combustible dust in air is not likely to occur in normal operation but, if it does occur, will persist for a short period only.

Note:

a. layers, deposits and heaps of combustible dust must be considered as sources which can form an explosive atmosphere if dispersed;

b. piles of dust may be subject to self-heating and layers of dusts may cause overheating of equipment; and become an ignition source; and

c. "Normal operation" means where installations are maintained or used within their design parameters.

24. The identification and classification of zones must be completed by a competent person. Factors which affect the calculations for the parameters of zones include (but are not limited to):

a. the release rate, size and density of the particles that form the vapour, mist, fumes or cloud;

b. building design;

c. ventilation;
d. the presence of oxidizing substances⁴;

e. the topography of the area if any release would not be constrained by natural or artificial barriers;

f. the presence of any pits, trenches or ditches that may trap and contain any release;

g. where tanks are being vented and vapours are being released;

h. the linking of adjacent hazardous zones for uniformity and clear demarcation purposes between hazardous and safe areas;

i. weather conditions including breezes, which may extend the hazard area, or hot weather that may increase the production of vapour; and

j. ambient temperature / humidity in buildings / facilities.

25. The zones surrounding some vehicles and installations may have already been calculated for temperate climates (up to 30°C) to allow a direct example approach to be applied. However, the process / activity being assessed must not differ from the examples in layout, equipment design, climate, or degree of ventilation. If there are any changes to these parameters, zones will need to be re-calculated using appropriate industry-based codes of practice as guidance by a competent person. Once identified, all hazard zones must be clearly marked on site plans denoting the classification of each zone. Guidance on DSEAR risk assessments for Bulk Fuel Installations can be found in JSP 317 Part 2 Chapter 1 (Storage and Handling of Fuels and Lubricants). Pipes, containers, valves, joints, take offs etc that transport or store dangerous or flammable substances may need to be zoned and identifiable; and included in hazardous area drawings.

26. Area classification and DSEAR risk assessment for installations in non-temperate regions must take account of the foreseeable range of ambient temperatures and the flashpoint of the dangerous material. If the flashpoint of the material is within 10°C of the maximum foreseeable ambient temperature, then the material must be considered as being flammable and hazardous area classification will be necessary. Heating from exposure to direct sunlight must also be taken into consideration as high levels of solar radiation can result in metal temperatures greater than 100°C.

27. Where a temporary process or activity is to be implemented which may generate an explosive atmosphere, this must be risk assessed by a competent person and if applicable, an appropriate temporary zone is to be established, suitable controls implemented, and the CO / HoE notified.

⁴ The presence of oxidising substances does not affect the extent of the zone; however, the presence of such materials may materially affect the risk of ignition and will promote combustion.
Assessing the Risk

28. All DSEAR risk assessments and mitigation measures for qualifying processes and activities on the Defence estate and for qualifying processes and activities undertaken elsewhere by the MOD must be compliant with the HSE L138 guidance.

29. A Stage 1 DSEAR risk assessment must be undertaken (to ascertain if a full DSEAR assessment is required) for any process or activity that is suspected to have the potential to create an explosive atmosphere in normal operation, handling, storage or maintenance; and recorded on MOD Form 5014.

30. If the Stage 1 DSEAR risk assessment identifies a possibility of dangerous substances or processes that may result in an explosive atmosphere, then a Stage 2 DSEAR risk assessment must be carried out following the template at Annex A, by a competent person(s) and in accordance with JSP 375 Volume 1, Chapter 8, or as part of a site safety case. The Stage 2 DSEAR risk assessment assesses the fire and explosion risks that may result from the ignition of the dangerous substances. A summary of the residual hazards and risks should be recorded on MOD Form 5014 (DSEAR risk assessment) and reference the relevant supporting evidence / documents.

31. Where required by the Stage 2 DSEAR risk assessment, Hazardous Area Classification Drawings (held by the MMO) / Estate Management Team) must be produced and conform to Annex B.

32. Two signatories are required who are directly involved in conducting the Stage 1 DSEAR risk assessment. The two signatories must not be the same person and will be:

   a. the manager responsible for the process; and

   b. an assessor qualified to at least NEBOSH General Certificate in Occupational Health and Safety (an IEng, or a national or MOD recognised equivalent) and undertaken suitable DSEAR awareness training.

33. To conduct a Stage 2 DSEAR risk assessment for the MOD, the assessment team must meet the same competence requirement as for conducting a Stage 1 risk assessment (with additional input from appropriate stakeholders ((e.g. MMO, Defence Fire Regulator)) where required). Where bespoke Hazardous Area Classification Drawings and zone calculations are required (i.e. not using industry standard or IP15 drawings), the person signing them off must hold a current Certification of Personnel Competency for IECEx Unit Ex 002 (or equivalent nationally recognised certified scheme) or provide evidence by other means of equivalent qualification, knowledge, experience, and quality assurance systems (see IECEx 05 and IEC 60079 series documents).

34. An Explosion Protection Document is to be produced which, where practicable, will incorporate:

   a. area classification reports and zonal drawings;
b. risk assessments;
c. restrictions on the type of protection method employed;
d. calculations (ventilation rates, Intrinsically Safe circuits etc);
e. material safety data sheets;
f. equipment design data (Gas Group, Temperature Class, Zone suitability);
g. equipment certificates (EX rating);
h. a register of all ex-equipment in hazardous zones including maintenance frequency;
i. equipment maintenance schedules;
j. inspection schedules;
k. maintenance records;
l. training records;
m. competence records; and
n. any other relevant data.

35. Where specific original information is not available, e.g. original design calculations or certificates, then an assessment should be made of the fitness for purpose of the equipment.

36. If a potential explosive atmosphere has been identified in the Stage 1 DSEAR risk assessment, then a Stage 2 DSEAR risk assessment must be carried out to assess the risk of fire and explosion that may result from the ignition of dangerous substances. These risk assessments must be completed in accordance with JSP 375 Volume 1, Chapter 8 and cover normal operation, maintenance and other work on or with plant, equipment and facilities and will include associated refuelling and decanting operations. The risk assessments must include the identification, consideration and careful examination of:

a. the hazardous properties of the substance;
b. information on safety provided by the supplier, including information contained in any relevant safety data sheet;
c. the circumstances of the work including:
d. the amount of the substance involved;
e. the work processes, procedures and substances used and their possible interactions;
f. where the work will involve more than one dangerous substance, the risk presented by such substances in combination; and

g. the arrangements for the safe handling, storage, transport and disposal of dangerous substances and of waste containing dangerous substances.

37. Activities, such as maintenance, where there is the potential for a high level of risk;

a. the effects of measures which have been or will be taken;

b. the likelihood that an explosive atmosphere will occur and its persistence;

c. the likelihood that ignition sources, including electrostatic discharges, will be present and become active and effective;

d. the scale of the anticipated effects of a fire or explosion;

e. any places which are or can be connected via openings to places in which explosive atmospheres may occur; and

f. any such additional safety information.

38. Examples of existing processes / records that may be required to assist / support a DSEAR risk assessment is contained in Annex C.

Mitigation and Control Measures

39. The control measures identified in the risk assessment must be put in place to eliminate risks from dangerous substances; or to reduce the probability of the risk occurring as far as is reasonably practicable; and to mitigate the effects of any fire or explosion. The best solution is to eliminate the risk completely by replacing the dangerous substance with another substance or employing a different work process. Where the risk cannot be eliminated, DSEAR requires control measures to be applied in the following priority order:

a. if possible, substitute with a non-hazardous substance;

b. reduce the quantity of dangerous substances to a minimum;

c. avoid or minimise releases of dangerous substances;

d. control releases of dangerous substances at source;

e. prevent the formation of a dangerous atmosphere;

f. collect, contain and remove any releases to a safe place (for example, through ventilation);

g. avoiding ignition sources in zoned areas, in particular those from electrical and mechanical equipment (including lightning protection);
h. avoid adverse conditions (for example, exceeding the limits of temperature or control settings) that could lead to danger;

i. keep incompatible substances apart; and

j. less hazardous alternatives or relocation of processes to a safer location (e.g. avoiding potential ignition sources).

40. In addition to the above controls, mitigation measures must be put in place to minimise casualties and collateral damage in the event of the risk being realised. These measures must be consistent with the risk assessment and appropriate to the nature of the activity or operation, and include:

a. reducing the number of employees exposed to the risk;

b. equipment and plant with the correct equipment and protective systems (EPS) categorisation;

c. providing explosion suppression or explosion relief equipment;

d. taking measures to control or minimise the spread of fires or explosions; and

e. providing suitable personal protective equipment (anti-static).

41. Site emergency procedures (JSP 375 Volume 1, Chapter 1) must be developed to cover any potential emergencies identified in the risk assessment process. These should cover regular safety drills; First Aid and suitable communication and warning systems proportionate to the risks. If an emergency occurs, workers tasked with carrying out repairs or other necessary work must be provided with the appropriate equipment to allow them to carry out this work safely. The information contained in the emergency plans and procedures, site plans and DSEAR risk assessment; must be made available in advance and on entry to the site, to the Emergency Services.

42. All plant, equipment, fixtures, fittings and tools etc. (including lighting, computers etc. in office spaces) used within a hazard zone must be rated as suitable for use in that zone classification or to a higher standard. The hazardous area zone classification and corresponding equipment categories are:

a. Zone 0 or Zone 20 - Category 1 equipment;

b. Zone 1 or Zone 21 - Category 2 equipment; and

c. Zone 2 or Zone 22 - Category 3 equipment.

43. The category will be suffixed with a letter denoting suitability for gas (G) or dust (D) zones. Equipment suitable for both gas and dust zones will be marked (GD) e.g. equipment suitable for Zone 1 or 21 will be marked as Category 2GD (note: pre-ATEX equipment may not have these markings).
44. The primary concern when maintaining plant and equipment is that it remains in a “fit for purpose” condition for the life of the installation. Consequently, the replacement of any components must be carried out by competent persons only using parts certified to be safe for use in an atmosphere compliant with or to a higher standard than that of the zone classification in which it is installed.

45. ATEX and pre-ATEX hazardous area equipment may not be modified as any modification may breach the protection of the device. If repairs are required, then these must be made using like-for-like spares.

**Retention of Records**

46. All records including the Unit / Establishment Register, Risk Assessments, etc. should be kept in accordance with JSP 375 Volume 1, Chapter 39.

**Related Documents**

47. The following documents should be consulted in conjunction with this chapter:

a. JSP 375 Volume1:
   (1) Chapter 06 - Safety Signs;
   (2) Chapter 08 - Risk Assessment;
   (3) Chapter 11 - Management of Hazardous Substances;
   (4) Chapter 15 - Personal Protective and Respiratory Protective Equipment; and

b. JSP 375 Volume 3:
   (1) Chapter 02 – Common Requirements;
   (2) Chapter 03 – Electricity;
   (3) Chapter 04 – Boilers & Pressure Systems;
   (4) Chapter 05 – Petroleum Installations; and
   (5) Chapter 06 – Confined Spaces.

c. Other MOD documentation:
   (1) DSA01.1 – Defence Policy for Health, Safety and Environmental Protection;
   (2) DSA01.2 Chapter 2 – Requirement for Safety and Environmental Management Systems in Defence;
(3) DSA02-DLSR - Defence Storage and Handling of Fuels and Lubricants Regulations;

(4) DSA02-DLSR - Defence Storage, Handling and Use of Gases Regulations;

(5) DSA02-OME - Defence Ordnance, Munitions and Explosives Regulations; and

(6) ESTC Standard N° 6.

d. Legislation and Guidance:

(1) Health and Safety at Work etc. Act 1974;

(2) Dangerous Substances and Explosive Atmospheres Regulations;

(3) Control of Substances Hazardous to Health Regulation;

(4) Classification, Labelling and Packaging of Substances and Mixtures (CLP Regulation);

(5) Management of Health and Safety at Work Regulations;

(6) The Equipment and Protective Systems Intended for Use in Potentially Explosive Atmospheres Regulations;

(7) The Regulatory Reform (Fire Safety) Order;

(8) HSE - L133 – Unloading petrol from road tankers;

(9) HSE - L138 - Dangerous substances and explosive atmospheres;

(10) International Electrotechnical Commission - IECEx 05 – Certificate of Personal Competence;

e. British Standards – these can be accessed via the Dstan site:

(1) BS EN 60079 series - Electrical apparatus for explosive atmospheres;

(2) BS EN 61241/3 - Electrical apparatus for use in the presence of combustible dust;

(3) BS EN 1127 series - Explosive Atmospheres – explosion prevention and protection.

5. Access to British Standards is via the Dstan site: http://dstan.uwh.dii.r.mil.uk/sol/index.htm
DSEAR Risk Assessment Report Format

1. DSEAR risk assessments carried out for hazardous processes on the MOD estate shall follow the requirements and report format detailed below.

Front Page

2. Include site details: date of assessment, hazardous area classification signatory, assessor and report reviewers’ names and qualifications (proof of competency) and company.

Introduction and background

3. Must be concise and specific to the site and hazardous processes assessed.

Executive Summary

4. Must be concise limited to half a page of A4.

Report Contents

5. Reference main and sub-headings and page numbers.

Inventory

6. A list of facilities / installations, personnel consulted, process method statements and risk assessments covered by the DSEAR assessment.

Hazard identification

7. List of all hazardous processes requiring risk assessment detailed in tabular format; the clients completed MOD 5014 parts 1 and 2 are to be included.

Prioritised Action Plan

8. Actions are to be prioritised by significance of risk with recommend completion dates; to be in tabulated format.

9. If the risk assessment is completed by an external consultant, then it may be difficult to tie down completion dates, especially if the risk assessment is done under contract to the Regional Prime Contractor. The best that could be achieved would be a recommendation.

DSEAR Risk Assessments

10. Undertake risk assessments to conform to DSEAR 2002 with particular reference to Regulations 5 and 6:
a. photographs can be used to identify the installations / facilities and / or equipment where they will add value but must be kept to a minimum;

b. each risk assessment shall detail site, facility / installation and date of inspection;

c. include the expected climatic conditions including the average annual maximum and minimum temperatures reached (where these are outside of normal UK maxima and minima);

d. include a concise description of the hazardous situation, process and products;

e. hazardous properties of the substances involved are to be presented in tabular format;

f. there shall be reference to existing control methods; there is no requirement to reproduce word for word the existing methods unless that control method is considered to be inadequate;

g. a statement whether existing control methods are adequate;

h. a list of all sources of product and grade of release must be considered and listed in tabular format;

i. identified risks that are not addressed by existing control methods are to be detailed in a table prioritised by significance of risk;

j. risk of any potential system failure (flange failure, pipe breakage, etc) are to be identified;

k. detailed with clear recommendations to enable the client to achieved sufficient control methods;

l. a summary of the zoned areas is to be included in table format and supported by calculations where relevant; and

m. a list of reference documentation utilised to complete the risk assessments shall be included.

**Distribution List**

11. Include all names / departments / sections for report distribution.
Requirements for the Production of Hazardous Area Classification Drawings

Introduction

1. An essential component of the Stage 2 DSEAR risk assessment is the production of hazardous area classification (HAC) drawings.

2. A hazardous area is defined as a three-dimensional space in which a flammable atmosphere may be expected to be present at such frequencies as to require special precautions for the design and construction of equipment and the control of other potential ignition sources.

3. The aim of area classification is to avoid ignition of those releases that may occur from time to time in the normal operation of facilities. The approach should always be to reduce the probability of coincidence of a flammable atmosphere and an electrical or other source of ignition and to minimise the extent of the hazard radii.

Drawing Specification

4. Drawings shall be compatible with and transferable onto existing site drawings, are to be legible, they must be capable of interpretation when printed at A3 size and when printed in black / grey only.

5. Drawings are to follow the format and style shown in the examples at Annex A and must include the following in context:
   a. relevant adjacent site features;
   b. manhole covers;
   c. topography relevant to the hazardous area and where there is a variance in levels of more than 1 metre up to 2 metres beyond the perimeter of the hazardous zone;
   d. pipework and pipelines;
   e. staircases and stairwells;
   f. above or below ground ducting;
   g. relevant electrical equipment; and
   h. relevant instrumentation.

6. Drawings must include a title block, which includes:
   a. the drawing number;
b. the drawing title;
c. the issuing company name;
d. drawn by;
e. date of issue; and
f. revision number.

7. Drawings shall utilise the preferred symbols for hazardous area zones as illustrated in fig C.1 Annex C of BS EN 60079 Part 10-1 Classification of areas- Explosive gas atmospheres.

For each establishment

8. A site plan indicating the location of all the designated hazardous areas for assets or installations must be produced. This is to include any temporary zones e.g. when fuelling from a tanker.

For each asset or installation incorporating a classified hazardous area

9. Each asset or installation incorporating a classified hazardous area shall be shown on a separate drawing depending on complexity.

10. Where assets or installations provide fuelling services to mobile assets such as aircraft or helicopters and where a flammable atmosphere may occur, these shall be included in the hazardous area classification exercise.

11. The drawing for each asset or installation incorporating a classified hazardous area shall be shown in plain view and in section or elevation as appropriate.

12. The plan view drawing shall show the classified hazardous areas in context to the site features within 2 metres of the hazardous zone. This should include buildings, culverts or other manufactured structures.

13. The drawing for each asset or installation incorporating a classified hazardous area shall clearly indicate the required temperature class and gas group for any equipment to be used in that area.
Diagram B.1 - DSEAR zones within a tank and the surrounding building.

For clarity the text boxes have been repeated to the side.

1. All dimensions are shown in millimetres.
2. Drawing to be read in conjunction with DSEAR risk assessment documents.
3. Where appropriate detail has been omitted for clarity.
5. Zoning and detail of above ground pipelines omitted for clarity.

**LEGEND**

**Zone 0**
A place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is present continuously or for long periods or frequently.

**Zone 1**
A place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is likely to occur in normal operation occasionally.

**Zone 2**
A place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if it does will persist for a short period only.
Diagram B.2 - DSEAR zones showing minimum separation distances between tanks and buildings / infrastructure.

For clarity the text boxes have been repeated to the side.

1. All dimensions are shown in millimetres.
2. Drawing to be read in conjunction with DSEAR risk assessment documents.
3. Where appropriate detail has been omitted for clarity.
5. Zoning and detail of above ground pipelines omitted for clarity.

**LEGEND**

Zone 0  
A place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is present continuously or for long periods or frequently.

Zone 1  
A place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is likely to occur in normal operation occasionally.

Zone 2  
A place in which an explosive atmosphere consisting of a mixture with air of dangerous substances in the form of gas, vapour or mist is not likely to occur in normal operation but, if does will persist for a short period only.
Supporting Records / Documents

Sources of existing information that may be required to assist / support a DSEAR risk assessment are listed below (list not exhaustive):

Potential DSEAR Related Facilities and Processes / Activities

This list is not exhaustive:

- Acetylene cylinder storage
- Aluminium welding and fabrication areas
- Battery charging (lead / acid)
- Bulk fuel installations
- Calor Gas field cooking bottles
- Cylinder storage (flammable)
- Flam. Store (COSHH) lockers
- Handling of propellant or explosive (out of the container)
- Hazardous waste areas, including drum stores
- Jerry can filling
- Jerry can storage
- Missile de-fuelling and re-fuelling
- Oil / water separators
- Oxygen cylinder stores
- Packaged goods stores
- Packaged oil and lubricant store
- Paint spray booth
- Paint store & areas
- POL Point
- LPG tanks
- Unburnt propellant
- Vehicle hangars
- Vehicle workshops
- Woodwork shop and dust filters
- Pump rooms
- Sewage treatment plant
