London had the smallest and Wales had the largest CO₂ per capita emissions in 2019*

Northern Ireland has the highest Land Use, Land Use Change and Forestry (LULUCF) emissions per capita (1.1 tCO₂ per person), and the highest domestic emissions per capita (1.8 tCO₂ per person).

Yorkshire and The Humber has the second highest Industrial sector CO₂ per capita emissions (2.2 tCO₂ per person).

Wales’ CO₂ per capita emissions are higher compared to other regions due to having the highest CO₂ per capita emissions from the Industrial sector (3.5 tCO₂ per person), reflecting its higher level of industrial installations.

London has the lowest CO₂ per capita emissions of any region due to the urban nature of the transport system, a high population density and its lower level of large industrial facilities than other regions.

The North East experienced the largest percentage reduction in CO₂ emissions from 2005 to 2019, in part due to industrial closures

Index: 2005 = 100

*Emissions per capita (per person) allow comparison between areas of different population size. However, emissions are driven by many factors other than resident population.
