Form MD 32-07 - Port Departure Procedure

Port Departure Procedure

PORT: W.P.

DATE:

29/06

AT 30 MINUTES NOTICE TO STAND BY:

- ✓ 1. Check load on switchboard. Two alternators to be running for stand by.
- ∠ 2. Check ME oil levels (T/C's, gearbox, governors, sumps)
- ∪ 3. Start reserve L.O. double and reserve reduction gear L.O. pumps.
- ✓ 4. Start CPP/VPP pumps.
- 5. Check CPP/VPP controls ECR & Bridge.
- ∨ 6. Propeller pitch is at Zero.
- 7. Start nozzle cooling pump.
- √ 8. Check fuel oil booster pump and visco-therm pump are running.
- y 9. Set visco-therm to normal operation position.
- 10.Switch off preheating pump and close valve
- 11.Start FW pump.
- 12. Turn engines with turning gear. Remove turning gear.
- √ 13. Open starting air valves
- 14.Start engine fans.

AT 20 MINUTES BEFORE STAND BY:

- 1. Kick engines over on air and close indicator cocks.
- 2. Follow procedure MD10/07 for starting engines.
- 3. Start main engines and run at 480 rpm. All to warm up.
- 4. Check stand by/reserve pumps are off.
- √ 5. Close all drains (T/C & air cooler) after checking for water.
- ✓ 6. Start main sea water pump.
- √ 7. Stop harbour circulating pump and open isolating valve.
- $\sqrt{8}$. Open sea water valves to gearbox and CPP/VPP coolers.
- √ 9. Increase main engine speed to 600rpm.

AT STAND BY:

- ✓ 1. Prove bridge to ECR communications.
- \vee 2. Confirm stand by with telegraphs.
- ∨ 3. If on ECR control change over to bridge control.
- √ 4. Power to bow thruster.
- 5. Complete relevant sections of movement sheet.
- ∠ 6. Complete ER log book confirming departure procedures completed.
 - v7. Close heeling pump isolating valves

SIGNED:

Emergency Checklist No.8 - Grounding/Stranding

GROUNDING / STRANDING

	The OOW must call the Master immediately after taking priority action to safeguard life
	The Master must call the Superintendent at the earliest opportunity after effecting the ships emergency priorities
	ME pitch to zero. Note time of grounding
	Sound the GENERAL EMERGENCY ALARM
	Inform Engine Room. Sea suctions to high
	Close watertight / fire doors
	Switch on deck lighting at night
	Exhibit lights/shapes and make appropriate sound signals
	Inform vessels in immediate vicinity
	Inform port authority
	Inform local Coastguard
	Fix ship's position and update GMDSS station if necessary
	Broadcast ALERT and MESSAGE: DISTRESS, URGENCY or SAFETY
	VHF to Channel 16
	Fire-fighting equipment ready for immediate use
	Damage assessment:
	Sound all compartments Casualties External damage Internal damage (visual inspection where possible) Check all watertight closures, stern glands and access doors remain tight Watertight integrity of hull Engine Room status Fire risk Pollution risk
	Check depth of water around ship. Determine where the deeper water lies. Determine nature of sea bed
	Ascertain time and height of tide. Obtain information on local tides and currents, particularly rise and fall.
	Monitor draughts and compare with flotation draughts
	If flooding refer to Emergency Checklist 10 - FLOODING
	If pollution: refer to Emergency Checklist 15 Spills - Damage to Vessel
	Consider:
	Possibility of floating off if no damage or if tide rising rapidly. This may be aided by pumping out ballast or adjusting trim Possibility of remaining in position particularly if bottom damage plugged by seabed Ballasting tanks to harden ship in position and reduce wave induced damage Tugs Port of refuge
図	When the emergency is over, broadcast to ALL STATIONS to cancel

Α	n	n	е	X	L

Form MD 28-07 - Local/Emergency Operation of Pitch Control

Moondance MD28-07 - Local/Emergency Operation of Pitch Control

Local/Emergency operation of Pitch Control

- 1. Establish communication with bridge via emergency telephone situated by port shaft, just forward of local control point.
- 2. Lift up floor plate and ensure it is secure.
- 3. Turn knurled nut clockwise so as to engage hand wheel with worm gear. Knurled nut is situated on the starboard side of each shafts pitch control unit.
- 4. Turn hand wheel to change pitch.
- 5. Check pointer to see what pitch is set. The pointer is situated by the knurled nut mentioned in 1, above.
- 6. To disengage hand wheel, turn knurled nut anti-clockwise.
- 7. Test pitch control from ECR and Bridge, to ensure all working correctly.

Annex F

Intakematic Marine Growth Protection System manual -Section 6 - Operating Instructions

6: OPERATING INSTRUCTIONS:

Once the system installation is complete and the system has been commissioned the power supply can be energised. Whilst reading these notes refer to the drawing of the power unit module controls and the system wiring diagram provided with this manual.

The current provided to each anode is adjusted by turning the potentiometer knob relating to that anode. The actual current being supplied as the knob is turned is shown by the Digital Display immediately above. The current settings required by this particular system are shown below:

Anode Reference	Anode Description	Normal Setting
CU 01	Copper 250/82.5	0.3 Amps
AL 01	Aluminium 250/82.5	0.3 Amps
CU 02	Copper 250/82.5	0.3 Amps
AL 02	Aluminium 250/82.5	0.3 Amps
FEOI	CASTIRON 50 82.5	0-3 Amps
FE 02	CAST (RON 250/82.5	0-3 Amps.

Notes:

- a) Where sea-chests and strainers are not in operation for a period of time it is advisable that current settings be reduced to 0.2A
- b) If infestation is present at the time of installation it is advisable that the current settings are increased by 0.2A for 4 weeks. This should accelerate the clearance of existing growth. Once growth has cleared it is important that normal system settings are used.

- c) When an anode has nearly consumed, its corresponding digital reading will show either a decline in current or CA. Once it is confirmed that the anodes life has ended, reduce the current setting to zero until the anode is replaced. For explanation of this and other alarm conditions the unit may display, refer to section 2 of this manual "Specification of Intakematic System"
- d) The effective operation of the system can only be determined by inspections of the sea-water system. It is suggested that if the opportunity to examine a strainer, length of piping or heat exchanger arises, it should be taken.

In all cases it should be remembered that where anode currents are increased, anode life will be reduced. Whilst all Wilson Taylor Systems are designed with a reserve of anode material a case could arise where the sea-water system is no longer being protected. Should there be any doubts about raising system currents, it is strongly recommended that the Wilson Taylor Technical Department be contacted for advice.

Seatruck Ferries internal ISM audit report dated 17 December 2007

To

(Safety & Quality Manager)

INTERNAL ISM AUDIT on M/V MOONDANCE

17th DECEMBER 2007 at HEYSHAM

An internal \$ISM audit was carried out by whilst the vessel was in Heysham port on a Monday lay over day. Safety procedures, safe working practices and correct use of personal protective clothing were observed throughout my time on board the vessel. The master & the crew extended every assistance to me during the audit.

The following crew members have been interviewed.

Captain

Chief Engineer

Chief Officer

2nd Officer

3rd Engineer

Electrician

Bosun

AB

AB

Cook

Stwd

Fitter

Motorman

All crew members showed a good knowledge of the Safety Management System relating to their specific duties and responsibilities on board. All crew knew who the designated person (DPA) is and had good knowledge of the company's Health & safety, Environment, Security & Drug & Alcohol policies.

The Following observations can be made.

- 1) Risk Assessments. Although there is a risk assessment form in the SMS as yet no risk assessments have been done & there is no risk assessment file in place. It is hoped that shore management team could produce some generic risk assessments and the ship's staff will then add some ship specific risk assessments to the file.
- 2) There is currently no paper copy of the completed planned maintenance reports on the deck and safety planned maintenance as there is a problem getting the printer in the ships office to print from a DOS program. Superintendent is aware

- 3) There is no copy of Chief Eng. Bahamas license (applied for in July 2007) though there is a copy of the Confirmation of Receipt of Application
- 4) Safety drills & training exercises are recorded in the official log book but not in the deck log book.
- 5) Change of ships security officer (Chief Eng to Chief Off) is not always recorded in the official log book (mostly not the change back to chief eng)

 Chief Eng to take a security officers course as soon as possible (office is aware and ship awaiting reply from personnel dept)
- 6) Hours of rest forms in E/R for engineering staff have not been signed by master or master's authorised representative. Master to appoint chief engineer as his representative, inform the office, and chief engineer then to countersign all hours of rest forms.
- 7) The company policy statements posted on the bridge are an old version. The ones on the notice board are the current version (master informed and corrective action carried out)
- 8) The engine room staff would like a safety cut off foot bar to be fitted on to the lathe in the workshop. This item to be brought up at the next on board safety meeting, and if considered a good idea to be submitted to the SQM for approval.

Many thanks to all the ships staff for their assistance in completing this audit.

Best Regards

Chief Engineer's Standing Orders

CHIEF ENGINEERS STANDING ORDERS

- 1. These standing orders are to be read in conjunction with relevant sections of the ships ISM manual.
- 2. Nothing in these standing orders shall be construed as relieving any engineer officer or member of engineroom staff of their responsibility as defined by law; government, classification society, flag state, or port state regulations; or from the exercise of sound professional judgement.
- 3. These standing orders are to be signed by all engineer and electrical officers. Signature sheet is at the front of this file
- 4. Safety of the vessel is secondary only to safety of personnel. Shipboard safety is to take precedence over all other considerations.
- 5. Engine room personnel joining the vessel for the first time are required to familiarise themselves with all the safety and emergency equipment onboard.

The engineer officers are to be familiar with there duties.

- 6. The company's drug and alcohol policies are to be strictly adhered to. On no account must alcohol be consumed or taken into any machinery space, control room or workshop.
- 7. On taking over a watch an engineer officer must familiarise himself as to:-
 - A) The general condition of the machinery.
- B) The progress of jobs during the previous watch, work location, and deployment of personnel.
- C) Operating parameters of main engines.
- D) Alternators in use and those available for use
- E) Fuel and lubricating levels
- F) Bilge conditions
- G) The progress of any transferring of fuel, lubricants, waste oils or bilges
- H) The security state and condition of machinery spaces as defined in the ship security manual
- 8. The relieving engineer officer must be fully satisfied with the above before he assumes responsibility of the watch

- 9. The Engineering Officer been relieved must be satisfied that the relieving officer is in a fit state to take over the watch.
- 10 The watch keeping officer must maintain frequent rounds of the machinery and must not solely rely on remote gauges and alarms.
- 11. All machinery shall be operated within the parameters set by the Chief Engineer Officer. However, this shall not prevent the engineer officer of the watch taking remedial action which, in his judgement, will avoid an accident, damage to the machinery or damage to the vessel.
- 12. The watch keeping officer shall ensure that there is sufficient generating capacity at all times, in order that the fire fighting capacity of the ship is not impeded.
- 13. Whilst the vessel is manoeuvring the watchkeeping officer or the Chief Engineer must in the control room at all times.
- 14. All transferring or bunker operations involving fuel, lubricating oil, waste oil, or bilges must be carried out in accordance with Chief Engineer's instructions and company regulations. Details of all transferring must be entered in the oil record book as required by port and flag state regulations.

15. BILGE PUMPING OVERBOARD PROCEDURES:

Bilge water overboard is only to be pumped through 15 ppm bilge water separator and in accepted locations, check with bridge. All pumping to be recorded in Oil Record Book.

No water to be pumped overboard without Chief Engineer's authorization.

Bilge water pumps to be operated by engineers only.

- 16. The engineer officer of the watch is responsible for maintaining the security of the machinery spaces and reporting any security breaches or concerns to the SSO.
- 17. Any machinery breakdown affecting the propulsion, manoeuvring capability, generating capacity or safety of the vessel must be reported immediately to the Chief Engineer officer.

18. SAFETY CHECKS:

Safety checks and emergency gear tests are to be carried out on a weekly basis, usually on Saturdays, and take priority over other routine work.

Test or checks of the following safety and emergency gear will include in the above routines and a record maintained in the engine room logbook.

EMERGENCY GENERATOR on load by opening supplies to emergency switchboard.

FIRST START ARRANGEMENT.

ALL FIRE PUMPS

LIFEBOAT ENGINE, (Starboard.)

FIRE ALARM PANEL

All BATTERIES, (to be recorded in battery log).

STEERING GEAR and CPP will be fully tested before leaving port.

Any defect in the above will be reported and dealt with as soon as possible.

19. L.O. TESTING

The main engine Lub oil will be tested for water content & viscosity on a weekly basis.

20. HANDOVER NOTES

When leaving the vessel all engineers, this includes electrician, to complete a handover report, in English, a copy of which must be handed to Chief Engineer.

21. IF IN DOUBT ASK, THE CHIEF ENGINEER OR SECOIND ENGINEER IS ALWAYS AVAILABLE!

Chief Engineer 19th September 2007

Chief Engineer 19th September 2007

Master's Bridge Watchkeeping Standing Orders

M/V MOONDANCE

MD06

Masters bridge watchkeeping standing orders.

All deck officers are to make themselves familiar with the following publications which are carried on board.

- 1 ICS Bridge procedures guide
- 2 Bridge team management, a practical guide.
- 3 MSN, MGN, MIN shipping notices
- 4 STCW 95
- 5 SOLAS
- 6 Company Safety Management Manual (SMM)

During the hours of darkness and in restricted visibility a lookout will be present on the bridge.

During the hours of daylight the lookout may work around the accommodation area but must be immediately available to the duty officer of the watch (OOW)

During heavy weather frequent inspections will be made on the vehicle decks and an extra man will be called if necessary. VHF communication by walkie talkie will be maintained between he seaman and the OOW during these inspections

A continuous listening watch is to be maintained on VHF 16 VHF 70 (DSC) & MF DSC frequencies. Channels 12 or 14 for port operations shall be monitored when in range.

The GMDSS log book shall be kept updated and all relevant details of tests and messages entered as necessary

Weather reports and shipping forecasts shall be obtained as often as possible

All relevant Navtex messages are to be initialled by the OOW, filed, and acted upon as necessary, charts affected shall be updated with the nav warning.

The vessels position is to be fixed at regular intervals using every possible means at the OOW's disposal.

Compass errors are to be taken at least once a crossing if possible and the gyro & magnetic compasses regularly compared.

Enter all relevant information in the deck log book, including the engineroom safety call during the times there is only 1 engineer in the engineroom..

When making an alteration of course for traffic as required by the international rules and regulations for preventing collisions at sea ensure it is positive, made in ample time and with due regard to the observance of good seamanship.

The engines are available for use at any time. A reduction of speed can be just as effective as an alteration of course.

Call the master if :-

Visibility falls below 1 mile

The movement, number, or proximity of other vessels is causing concern

There is difficulty in maintaining the vessels course

There is any doubt regarding the vessels position

There is engine or steering gear failure or any malfunction of bridge equipment

Heavy weather is encountered

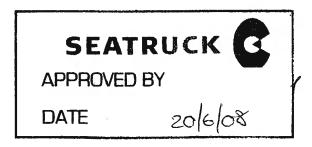

There is potential danger to the ship or cargo

There is any emergency, including fire, man overboard, distress traffic or a pollution / environmental incident.

There is anything you are unsure about.

IF YOU ARE IN ANY DOUBT OR UNSURE IF YOU SHOULD CALL, THEN CALL THE MASTER. THAT IS WHAT HE IS HERE FOR.

Moondance - June 2008.

Chief Engineer's technical instruction MD11 Change Over of Vessel's Power Source and SMS Section 4 Ship Specific Procedures/Forms/Guidelines instruction MD11 Ballasting Procedures

Change over of vessel's power source

Before changing the power source of the vessel from Diesel Alternators to Shaft Alternator, or from Shaft Alternator to Diesel Alternator, it is essential that permission is obtained from the officer of the watch on the bridge, as a malfunction and power failure could result in a hazard to navigation and cause the vessel to be endangered.

M.V.Moondance

MD11

Ballasting Procedures

The Chief Officer is solely responsible for Ballasting during cargo operations, whether using the Manual or Automatic Heeling Tank system.

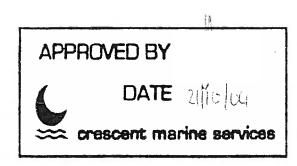

On departure when the vessel is satisfactorily upright the system will be shut down and the valves closed.

There must be prior dialogue between the Chief Officer and Chief Engineer/Duty Engineer if either party wishes to heel the vessel during a port layover for Bunkering, washing-down etc.

Any transfer of ballast at sea between the heeling tanks must first be discussed by the Duty Engineer and Bridge OOW and then closely monitored.

Apart from the heeling tanks, no ballast is to be moved without the Master's knowledge and assent.

Apart from the heeling tanks, any tank which has ballast added or removed must be immediately sounded to confirm the situation.

Controllable Pitch Propellers

In order for a good record to be kept of when the local control of CPP is tested please include in your annual drill schedule. Local/Emergency control of C.P.P. on a 3 Monthly basis.

In addition can you ensure that a notice is permanently displayed at the engine controls on the bridge and in the Engine Room stating:

'in the event of loss of hydraulic pressure pitch will move to full astern when shaft turning.'

Best regards.

Master / Chief Engineer Officer, all Seatruck vessels

Re:

MOONDANCE GROUNDING - CORRECTIVE ACTION

Gentlemen,

On 29 June 2008, Moondance grounded in Warrenpoint Harbour, following a complete electrical power failure, causing irreparable damage to both rudder stocks.

Following the incident the Company has conducted an extensive investigation to establish the causes and circumstances leading to the grounding with the objective of improving safety from the lessons learnt.

Although the actual cause of the black-out cannot be fully ascertained, it seems most likely that the black-out was the result of the cross-connection isolating valve to the generators not being open, thus resulting in the engines overheating and shutting down. This caused the CPP to fail and default to the astern position.

During the course of the investigation a number of shipboard practices were identified as being detrimental to the safety of the vessel. In most cases these practices indicated varying degrees of complacency. The nature of our trade requires the same routines to be carried out frequently, which unless properly monitored and managed will lead to complacency.

These practices will be addressed in the forthcoming major review of the Company's Safety Management System; however it is prudent that various instructions be issued immediately. In due course these instructions will be included in the Safety Management Manual.

Although the Company is taking action by issuing these instructions, the nature of the practices leading to the incident, indicated a failure to observe good seamanship and not necessarily a failure of the Safety Management System. The effectiveness of the SMS relies upon senior officers ensuring its strict compliance. It is the duty of all personnel to adopt the highest possible professional standards.

These instructions apply to all vessels.

ENGINE ROOM MANNING

At all times that the vessel is in pilotage waters, including shifting berths, and the main engines are on standby the Chief Engineer Officer (CEO) must be immediately available to the Engineer Officer of the Watch (EOOW). In all cases that a checklist has been completed prior to departure or arrival by the EOOW, the CEO must, so far as practicable, satisfy himself that such checks have been satisfactorily completed. Where the CEO deems it necessary that his presence would be best suited at a place other than the Engine Control Room then he must inform the EOOW of his whereabouts and establish the most effective means of communication, such that the EOOW can immediately contact him.

BRIDGE MANNING

At all times that the vessel is in pilotage waters, including shifting berths, the minimum deck officer manning requirement on the bridge is the Master and an Officer of the Watch.

ENGINEER OFFICER OF THE WATCH HANDOVERS

Where a change of watch is due immediately before a critical event, such as shifting ship, that changeover should be re-scheduled, or the off-going Officer should retain control until completion of the event. In all cases the off-going officer must ensure that the on-coming officer receives a thorough handover and must satisfy himself that handover has been fully understood. Likewise, the on-coming officer must ensure that he receives a thorough handover and not take control until he his entirely satisfied.

CHECKLISTS

On every occasion that a checklist is required to be completed, such checks must be performed methodically and accurately. So far as practicable, the checklist must be consulted frequently whilst carrying out checks. Items that have not been checked must not be marked as such. Bridge checklists must be countersigned by the Master and Engine Room checklists by the Chief Engineer Officer. The pre-completion of checklists, or any part of a checklist, is strictly forbidden.

FAILURE OF CPP

Every Deck and Engineer Officer must be fully conversant with the effect a power failure will have on the CPP system and the resultant pitch. Additionally, prominent notices must be placed by each main engine control position on the bridge and in the ECR, e.g. "IN THE EVENT OF A CPP FAILURE THE PITCH WILL MOVE TO (full astern / full ahead / neutral)".

MANOEUVRING INDICATIONS

Extreme caution should be exercised during a power failure when observing manoeuvring indicators (e.g. main engine RPM), as they may not be supplied by the emergency source of power. This is particularly important where an indicator is showing zero. For example, if the shaft RPMs are indicating zero, it should not be assumed that the main engines have stopped. During routine black-out exercises, observations should be made and recorded of the effect this has on each item of equipment.

MAIN ENGINE EMERGENCY STOPS

All Deck Officers should be aware of the function of main engine emergency stops. Such controls should be routinely tested in cooperation with the ECR as part of the vessel's planned maintenance.

RECORDING TIMES

Times of navigational events should be recorded accurately. Bridge and engine room clocks should be synchronised as part of pre-arrival and pre-departure checklists.

COMMUNICATIONS

It is imperative that during an emergency situation an effective stream of information is maintained, particularly between the bridge and engine room.

A forthcoming major review of the Safety Management System will include all of the above instructions. In the meantime I would welcome any suggestions you may have to further improve our operating practices and indeed ways in which we can protect against complacency.

Regards,

SQM Manager
