| 16:20 | **Open Discussion** |
| 17:00 | **CLOSE**<br>Melanie Welham, BBSRC |

# C O N T E N T S

# Welcome and Introduction

## Organisers' Welcome

Welcome to the ZELS inaugural event. This event is being co-led by the Programme funders.

We would like to extend our grateful thanks to all speakers, chairs and delegates for their input to this event. We hope your experience will be valuable and rewarding.

## Aims of the Inaugural Event

- To announce the start of the ZELS programme;
- To foster collaboration between the projects, and to develop links between researchers and funders;
- To develop a communication framework for the programme;
- To provide ZELS grantholders with an overview of the funding partners' expectations, particularly around project management, pathways to impact and multidisciplinarity;
- To advise grantholders of reporting procedures and ZELS logical framework (logframe) indicators.

## About ZELS

### Funding

ZELS is a GBP 20.5M jointly-funded research initiative between:

- Biotechnology and Biological Sciences Research Council (BBSRC)
- Defence Science and Technology Laboratory (Dstl)
- Department for International Development (DFID)
- Economic and Social Sciences Research Council (ESRC)
- Medical Research Council (MRC)
- Natural Environment Research Council (NERC)

### Vision

The vision of ZELS is to make a step change in the research evidence available to inform decision makers on how to minimise the health risks associated with the rapidly changing nature of livestock systems in developing countries, focusing on those risks which impact on the livelihoods and health of poor people.

### Aims

The key aims of the Programme are:

- To reduce the impact of zoonoses on poor people and their livestock. The initiative recognises that priorities for endemic, new and/or (re)-emerging zoonotic diseases may vary from region to region. It will address the problem of zoonoses by generating high quality research in technical and policy areas
- To forge mutually-beneficial inter- and multi-disciplinary partnerships between researchers in the UK and developing countries that create trans-national added value through meaningful intellectual collaboration, and enhance the scientific capabilities of southern partners for the longer term.

**Scope**
ZELS research scope will be multi-level, interconnected and will address the aim of reducing the impact of zoonosis on poor people and their livestock in developing countries.

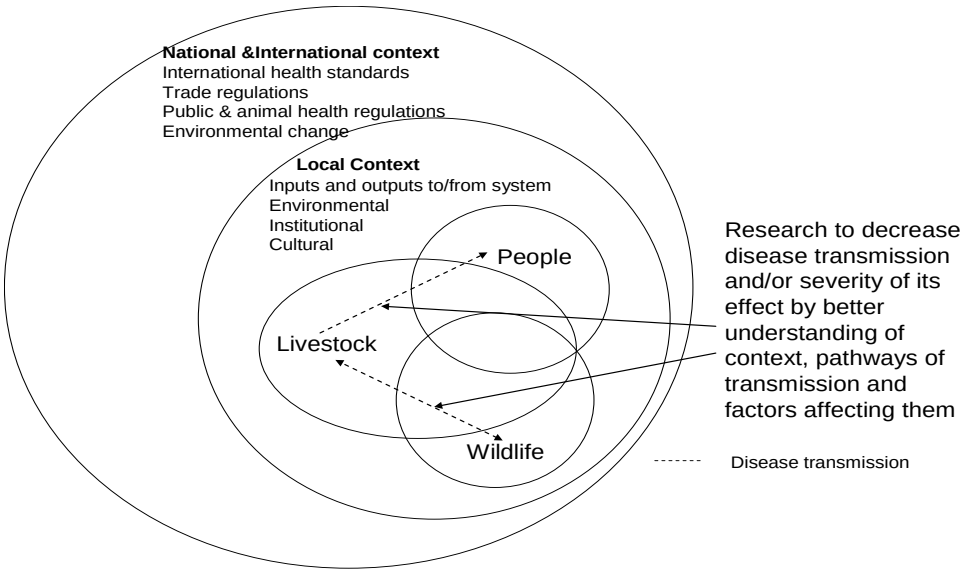

Fig. 1 Illustration of the scope of the programme

**Research and Training**
The initiative is made up of 11 projects which will investigate emerging and endemic zoonotic diseases in developing countries.

Over the next five years, UK researchers will work in partnership with more than 30 overseas institutes and organisations to generate scientific evidence to inform the selection of risk-based and cost-effective prevention and control options which may contribute to decreasing the likelihood of occurrence, prevent the transmission, and reduce the impact of major zoonotic diseases.

The projects will also offer significant benefits to British farmers and consumers. Several of the zoonoses being tackled by the initiative have already had serious consequences in the UK. Global supply chain systems and climate change may result in more zoonoses crossing our borders.

A key outcome of these collaborations is to enhance the scientific capabilities of developing countries for the longer term. £1.5M of the funding has been set aside specifically to do this; 15 students from the UK and developing countries will receive doctoral training in ZELS related research.

# ZELS Projects

***Social, Economic and Environmental Drivers of Zoonoses in Tanzania (SEEDZ)***

Livestock systems in Africa are undergoing rapid transition. Changes in market dynamics, land-use and agricultural policy, environmental factors, cultural practices and technology are all changing the way people keep and manage livestock, both for food and as sources of income. However, the consequences of these changes on zoonotic disease risk are almost unknown.

This project is focusing on Brucellosis, Q-fever and Rift Valley Fever (RVF) which can all result in livestock production losses and cause severe illnesses in people, with the potential for chronic disability or death. Fever-causing zoonoses, such as these, are particularly problematic because they are difficult to diagnose on symptoms alone, and in sub-Saharan Africa are almost always misdiagnosed, with serious consequences for human health.

An interdisciplinary team of researchers from the UK, Tanzania, New Zealand and the USA will be examining how social, economic and environmental drivers of change affect zoonotic disease risks through changing patterns of livestock ownership, management and human behaviour.

The case of Tanzania will be used to explore the nature of livestock systems, focusing on two systems undergoing rapid transition: (1) the pastoral-wildlife sector affected particularly by expansion of crop-based agriculture and changes in land-use policy, and (2) the peri-urban livestock sector.

## *Zoonoses in Livestock in Kenya (ZooLINK)*

Continuing changes to livestock production systems in Kenya and elsewhere to satisfy increased demand for livestock products affect the risk of zoonoses and other infectious diseases. The most important changes are the commercialisation and intensification of what was previously subsistence farming, changes in trading patterns (e.g. the distances that livestock and their products are transported), and changes in favoured breeds.

There is therefore a pressing need for good surveillance of zoonoses in order to establish their true burden, how that is changing and to support control measures.

Researchers from the UK and Kenya are joining forces with Kenyan government departments to provide evidence that an enhanced surveillance system can contribute to improving public health in a cost-effective manner. They will achieve this by increasing awareness of zoonoses, improving diagnostic support (including developing new diagnostic assays), enhancing the recording, storage, analysis, interpretation and sharing of data, and by bringing about closer integration between the human and animal health sectors.

During the five year project researchers working in western Kenya will closely monitor, model and optimise the enhanced surveillance system's performance, and undertake a comprehensive economic analysis of the activities. The evidence will contribute to a better understanding and anticipation of changes in zoonotic disease burdens, and to recommendations for effective interventions.

The research will also provide a platform for Kenyan public and animal health workers to get hands-on training and to become familiar with a 'One Health' approach to surveillance, creating a cadre of individuals with first-hand experience of this way of working - leaving a strong legacy in its own right.

## *Establishment of a multi-sectoral strategy for the control of brucellosis in the main peri-urban dairy production zones of West and Central Africa*

As one of the most prevalent zoonotic diseases, brucellosis is an important constraint on the livelihoods of poor people, directly by causing chronic disability and indirectly via decreased livestock productivity. The heaviest burden is on vulnerable populations in Sub-Saharan Africa, in particular West and Central Africa, where emergent livestock systems are rapidly expanding to meet demand for milk from burgeoning urban populations.

The main routes by which people can be infected by brucellosis are consumption of contaminated dairy products and direct contact with infected animals. Therefore, the control of human brucellosis depends on its control in animals, mainly ruminants.

Researchers from the UK and Senegal are taking an interdisciplinary approach to consider the different biological, social and institutional dimensions of the disease relevant for its control. The main focus is on the first phase of control of the disease: the reduction of prevalence by vaccination.

Field studies in a number of countries in West and Central Africa will measure the burden of brucellosis in livestock, identify routes by which people become infected, assess farmers' perceptions and attitudes toward the disease, assess vaccines for effectiveness in livestock, and explore key stakeholder and institutional relationships to identify how to effectively deliver control measures for brucellosis.

## *Molecular epidemiology of brucellosis in northern Tanzania*

Brucellosis is one of most widespread human diseases acquired from animals, and is one of the highest priority animal diseases in Africa.

Brucellosis infects many animal species, including key livestock species - cattle, sheep, and goats - and most human infections are acquired through direct contact with livestock or transmission through untreated milk products. Brucellosis has wide-ranging impacts that include animal losses due to abortion, lost milk production, slaughter of infected animals, and human illness reducing work capacity.

Researchers in the UK, Tanzania and New Zealand will collaborate to develop the evidence-base to inform the use of *Brucella* vaccines in sub-Saharan Africa, and build capacity in Tanzanian laboratories to identify the disease. The project aims to identify the ruminant species that act as sources of human infection and the *Brucella* species most responsible for human disease in rural and urban environments in northern Tanzania. This project will provide the first large systematic evidence base to guide which vaccine should be used in which animal population.

The research will be conducted hand-in-hand with Tanzanian government scientists charged with formulating national policies for the control of brucellosis.

## *Combating avian influenza through systematic analysis of antigenic drift, genetic variation, and development of novel diagnostic tools and vaccines*

Dramatic progress has been made in providing animal protein at affordable prices to rapidly expanding populations. Poultry production in developing countries has helped meet goals in poverty alleviation and reduction in rural unemployment, particularly amongst women.

However, the emergence and spread of avian influenza viruses in many countries has threatened the sustainability of the poultry sector by incurring heavy losses in poultry production.

Avian influenza virus (AIV) is classified into highly pathogenic (HPAI), e.g. H5N1, and low pathogenic (LPAI) forms based on the severity of the illness they cause in poultry. The rapid genetic evolution of these viruses in birds remains a credible threat for pandemic emergence.

Large scale culling in response to outbreaks of disease in poor countries has become impractical for economic, ecological and ethical reasons.

A multidisciplinary research team from the UK, Vietnam and Pakistan will exploit next generation biotechnological approaches to advance our understanding of how genetic and antigenic diversity influence the protective power of poultry AIV vaccines and the sensitivity of diagnostic tests to differentiate AIV subtypes.

The research aims to develop more effective intervention strategies to minimise economic losses due to influenza within the poultry sector, and to mitigate the risk of pandemic emergence. Better control measures may offer substantial benefits to wider communities on both the national and global scale.

## *Integrated management-based approach for surveillance and control of zoonoses in emerging livestock systems: South East Asia Pig & Poultry Partnership*

Endemic zoonotic diseases, primarily gastrointestinal infections, put the heaviest global burden on the health of poor people, and on productivity and profitability of their livestock. It is estimated that zoonotic gastrointestinal disease, caused by bacteria such as *Salmonella* and *Campylobacter* and related antibiotic resistance, accounts for around 1M human deaths per year globally with around 800M people being affected, most of them children under five-years-old.

Diverse emerging livestock systems, specifically pig and poultry production, are thought to be major sources of these infections.

The project will focus on the pig production sector in Myanmar which, of all the countries in the world, is expected to show the most rapid growth in pig production by 2030.

The project will exploit interdisciplinary expertise that includes social science, biological science, and governmental players from Myanmar, Vietnam and the UK. It will bring about step changes in control measures using knowledge-driven and culturally relevant strategies that improve both animal health and productivity and thus improve and protect human health.

## *Controlling and monitoring emerging zoonoses in the poultry farming and trading system in Bangladesh: an interplay between pathogens, people, policy*

Improvements in living standards and in global trade mean that there is a rapidly rising demand for and supply of animal protein. Poultry and specifically chickens are the major source of all protein consumed in the world and poultry production, adapting better than any other livestock sector to increased demand, will further expand in the near future. Intensification of poultry production sectors will increase the risk of future disease emergence including highly pathogenic avian influenza.

Outbreaks of new strains of influenza, such as H5N1, can have up to 100% mortality in chickens and other domestic poultry and very high mortality rates in human beings when the influenza "jumps" species from the animal/bird reservoir to humans.

When a new outbreak occurs, farmers and traders may change their behaviour to avoid economic losses. Such behavioural changes can modify the way disease spreads, and even prolong and strengthen the epidemic so that it becomes a widespread pandemic moving beyond a local area to the whole world.

Researchers from the UK, Bangladesh and Australia are joining forces to study the behaviour of people working in the Bangladeshi poultry farming and trading system. By combining sophisticated mathematical modelling of how poultry production and marketing works with detailed analysis of the social, cultural and economic factors which may promote disease maintenance and dissemination in Bangladesh, the collaboration aims to develop effective policies to reduce the risk of people's behaviour causing widespread disease dissemination.

## *Life on the edge: tackling human African trypanosomiasis on the edge of wilderness areas*

Tsetse flies transmit trypanosomes, microscopic parasites which cause sleeping sickness (Human African Trypanosomiasis or HAT). There is no vaccine or drug for the disease and it is ultimately fatal if left untreated. In eastern and southern Africa, about 12M people are at risk of Rhodesian HAT, an acute form of the disease caused by *Trypanosoma brucei rhodesiense.*

Rhodesian HAT is especially difficult to control because the trypanosome which causes it is present in a range of wild mammals and livestock. In wilderness areas, tsetse flies infected after feeding on wildlife can spread the disease to people and livestock in surrounding areas and livestock can consequently become a source of further infection to people.

Researchers from the UK, Tanzania and South Africa will spend the next three years identifying cost effective and "ecologically smart" strategies to control HAT to protect local people living around the Serengeti, focusing on disease hotspots at the boundary between wilderness and settled areas. Tsetse flies also carry other trypanosomes that cause serious disease in livestock, so control of HAT will also bring added benefits in reducing livestock disease and boosting the productivity of small-holder farmers.

The researchers will develop recommendations for farmers, doctors, veterinarians and managers of wildlife areas for control of the disease in humans and animals in the Serengeti area, and generate guidance on monitoring and managing HAT in wilderness areas.

## *Epidemiology and evolution of zoonotic schistosomiasis in a changing world*

Schistosomiasis affects more than 240M people worldwide, and over 700M people live in endemic areas (WHO, 2014). Caused by schistosome parasitic worms, schistosomiasis is a disease that causes chronic and debilitating illness in people (typically the poor) who come into contact with fresh water where there are snails infected with the larval stages of the parasite. Species of schistosomes are also common in cattle, sheep and goats.

Environmental change and changes in agricultural practices may increase the potential for disease transmission and increase the opportunities for mixing of different species of human and animal schistosomes. This mixing within the human or animal hosts can result in novel hybrids which may influence their potential for disease transmission and morbidity.

A multidisciplinary team of researchers from the UK, Niger and Senegal, will spend the next three years in an effort to understand the populations at risk of infection and disease with hybrid schistosomes, with a view to informing control programmes, including schistosomiasis elimination.

The researchers also aim to produce new diagnostic tests and surveillance methods for use in the field.

The project will help scientists document the evolution of a zoonotic infection.

## *ETHICOBOTS (Ethiopia Control of Bovine Tuberculosis Strategies)*

Ethiopia has the largest livestock population in Africa including 53M cattle. A rapidly growing human population (85M people) and high rate of urbanisation puts more pressure on farmers to meet the demand for food.

In Ethiopia livestock contributes to a high proportion of national income and is key to economic development. Traditional, extensive farming systems with the less productive local Zebu cattle are being supplemented and replaced with intensive farming of imported breeds such as Holstein-Friesian at a rapid rate.

Although bovine tuberculosis (bTB) is endemic in Ethiopia the prevalence is low among the local Zebu cattle, potentially because they are extensively reared and seemingly relatively resistant to the disease. Expansion of dairy farms around major urban centres has however created hotspots of TB infected cattle. With no legal requirement to test and cull infected cattle in Ethiopia, unlike in developed countries, the potential for rapid spread of bTB across the cattle trade routes through amplification by the dairy farms in these areas is a real emerging danger.

Working closely with government and local communities, researchers from the UK, Ethiopia and Switzerland will determine disease prevalence among dairy cattle in different areas, study risk management and mitigation practices for households and document how prevailing social, cultural and economic factors impact them. The researchers will compare disease susceptibility among the local and Holstein cattle and evaluate the degree of protection given by vaccination to cross-breed cattle.

The results will provide practical and effective bTB control strategies, which when applied, will significantly reduce the high rate of bTB and its zoonotic transfer in the expanding dairy sector; minimize trading of bTB infected dairy cattle to protect the national Zebu herd and the livelihood of poor farmers; and reduce the risk of zoonosis in high risk populations.

## *Hazards Associated with Zoonotic enteric pathogens in Emerging Livestock meat pathways (HAZEL)*

Whilst meat production for the commercial market offers an economic opportunity to poor farmers in developing countries, changes to meat supply systems may have major implications for food-borne diseases because risks of infection and contamination are likely to increase with production intensification of production and advancing complexity in getting food from farm to fork.

Tanzania has been identified as a hotspot for bacterial foodborne disease, including disease caused by *Salmonella* and *Campylobacter*, bacteria that may be carried by ruminants and poultry. Most livestock meat supply chains in Tanzania are informal but commercial supply chains and markets are expanding rapidly to meet growing demand from consumers. Changes in the meat supply chain may contribute to the foodborne disease risk.

A multidisciplinary team of researchers from the UK, Tanzania, New Zealand and the USA will spend the next three years assessing the microbiological hazards for human health in emerging systems of livestock meat production, processing, distribution and consumption in Tanzania. Their approach will involve a mixture of social and biological science, including field and laboratory activities and a technique known as modular process risk modelling (MPRM).

The researchers will also conduct systematic reviews of national and international regulations and policy as well as key informant interviews to identify strengths, weaknesses, opportunities, and threats (SWOT) in current food safety policy. SWOT analysis will be informed by MPRM findings to identify gaps and suggest improvements to national, regional, and international food safety policies.

## *International training for the next generation of scientists*

The ZELS projects have formed a consortium to provide a concentrated focus for doctoral training in ZELS-related research. Through the ZELS-Associated Studentships (ZELS-AS) a single intake of 15 UK and developing country students will commence training in October 2015.

Each student will spend half their time in the UK and the other half in a developing country, and will have two supervisors, one in the home country and one in the host country.

The training environment will provide students with excellent opportunities to gain transferrable skills and to conduct original and scientifically excellent research, building a strong and active cohort of students who are able, and
encouraged, to work together.

ZELS-AS will build research capacity in the UK and developing countries, aligned with the aim of reducing the impact of zoonoses on poor people and their livestock.

# ZELS ANNUAL REPORT FORM

| SECTION 1: PROJECT DETAILS | | | | |
|---|---|---|---|---|
| **Grant Reference** | | | | |
| **Start Date** | **End Date** | **Duration (mths)** | **Extension (mths)** | **Grant Value (£)** |
| | | | | |

| **Principal Investigator** | | | | |
| **Lead Research Organisation & Department** | | | | |
| **Co-Investigator(s)** | | **Research Organisation** | | |
| | | | | |

| SECTION 2: PROJECT PROGRESS | |
|---|---|
| **Original objectives of research with proposed timescales for each objective with milestones** (including any agreed amendment).<br><br>Use one row per objective. | **Progress – <u>in the past 12 months</u> - against objectives and milestones.**<br><br>If the project has suffered any setbacks, please indicate what, if any, remedial action will be taken and whether, and to what extent, the outcome of the project will be affected. |
| 1. | |
| 2. | |
| 3. | |

## SECTION 3: OUTPUTS

### OUTPUT 1: Collaborative research generates high quality research products of relevance to, and usable by, developing countries

Indicator 1.1: Programme management – BBSRC Programme Manager to complete

Indicator 1.2: Strengthen stakeholder engagement

*Provide a summary of activities, e.g. workshops, which have enhanced stakeholder engagement. Stakeholder organisations should be named.*

| **Indicator 1.3: Composite publications index score (see Annex 1)** |
|---|
| *e.g. journal papers, book, book chapter, conference paper, policy brief, in-house publication, in-house published products. List under the respective headings and indicate if the lead author is a developing country researcher.* |
| **Refereed journal paper – open access** |
| **Refereed journal paper – not open access** |
| **Book or book chapter** |
| **International conference paper (DFID priority)** |
| **Policy brief (with defined audience)** |
| **Other conference papers (incl. proceedings)** |
| **In-house publication/product (peer reviewed externally)** |
| **In-house publication/product (not peer reviewed externally)** |
| **Mass media publications (newspaper features, magazine articles, TV and radio within UK and developing countries)** |

## SECTION 3: OUTPUTS – cont.

### OUTPUT 2: Strengthen developing country science base

**Indicator 2.1: Number of animal and human health-related advances (knowledge/methodologies/techniques/tools/resources/interventions) appropriate to the relevant socio-economic and environmental context easily accessible to developing countries**

| |
|---|
| *List under the respective headings*<br>**Knowledge** |
| **Methodologies** |
| **Techniques** |
| **Tools** |
| **Resources** |
| **Interventions** |

**Indicator 2.2: Number of training opportunities, defined by training index score (knowledge/skills-based short courses; PhD; research fellowships; workshops; exchange visits; mentoring; knowledge-based networks; on the job training; self-study/guided reading)**

*Provide a summary of the nature, duration and progress of any training provided by the grantholder during the reporting period as part of this project. Include number of delegates/students per item and, if delegates completed a training evaluation, an assessment of the level of achievement of the training.*

| Training | Duration | No. of Delegates |
|---|---|---|
| | | |
| | | |
| | | |

**Indicator 2.3: Number and description of research partnerships leveraging additional resources for work in related areas led by (a) Southern partners; and (b) Other partners**

| |
|---|
| *"Partnerships" means scientific collaborations with joint outputs; "Additional Resources" means cash funds and other inputs (e.g. staff, equipment, etc), where non-cash or in-kind resources are leveraged they should be specified* |
| **Southern partners** |
| **Other partners** |

## SECTION 3: OUTPUTS – cont.

### OUTPUT 3: Improved livelihoods for poor livestock keepers in developing countries

**Indicator 3.1: Number of human and animal health-related advances (knowledge/methodologies/techniques/tools/resources/interventions) appropriate to the relevant socio-economic and environmental context developed of relevance to (a) the poor, (b) women – see** Error! Reference source not found.

| **Human and animal health-related advance** *– with justification for its relevance* | **Of relevance to** | |
|---|---|---|
| | **the poor** | **women** |
| **knowledge** | | |
| **methodologies** | | |
| **techniques** | | |
| **tools** | | |
| **resources** | | |
| **interventions** | | |

## SECTION 3: OUTPUTS – cont.

### OUTPUT 4: Research partnerships and networks established and communication pathways developed that significantly improve the quality and scope of research and the uptake and adoption of outputs.

**Indicator 4.1: ZELS running as an integrated programme with research groups collaborating and linking to other zoonoses and livestock development projects and programmes**

*Provide a summary of collaborative links with other ZELS projects and/or other research programmes or projects*

**Indicator 4.2: Increased global awareness of zoonoses as a pro poor issue through targeted communication activities; greater inclusion of farmers, women, and the private sector in policy-making.**

*Provide a summary of (1) participatory meetings (number and size of audience segregated by gender) and publication of their outcomes as appropriate (2) Communication activities, including the size of audience reached by each of the activities (and segregated by gender where possible).*

| | Audience | |
|---|---|---|
| | **Total** | **Women** |
| **(1) participatory meetings (state what category of participant, e.g. farmer, policymaker, etc.)** | | |
| **(2) communication activities** | | |

**Indicator 4.3: Increased awareness of zoonoses as an issue in developing countries among policy makers, regulatory authorities, international organisations and animal/public health workers. Enhancing awareness of ZELS programme.**

*Please list national and international meetings, and how the project contributed; policy briefings, newsletters, case studies, etc. with a brief description.*

## SECTION 4: CASE STUDY

The funding partners are keen to publicise the outcomes of the research and associated knowledge exchange and capacity-building activities throughout the lifetime of the initiative. This section may be used by the funders as the basis for producing a case study. In your response you should address the following questions:

* Why carry out this research? What does it seek to achieve?
* What difference will this research make to the lives of poor people?
* What is new, innovative or clever?
* Who will use this research and how?
* What will the outputs be?
* How will this research help to save money in the long run?
