Enrolment
- FPE and the market for private schooling
- Has FPE reduced inequality in educational attainment?

Achievement

Conclusions
From “Harambee” to FPE

Harambee

- Movement focused on self-help; focus on education and development. Concretely, fundraising drives, usually involving a public gathering.
- Actively cultivated by the Kenyatta gov’t after independence. Contributions were intended to be voluntary.
- In practice school committees often set and recorded contribution levels.

FPE

- Fees abolished in all gov’t schools as of the 2003 academic year.
- Funding for non-salary expenditure comes in the form of a capitation grant from the central government.

Constant

- All teachers recruited, hired/fired, assigned/reassigned and paid centrally.
- School Management Committees (SMCs) have official governing authority for each school.

FPE in a Supply & Demand Framework
FPE in a Supply & Demand Framework
Theoretical Mechanisms at Work under FPE

Three channels linking FPE to student performance:

1. **Increased funding (perhaps)**
   - Increased government funding
   - Ambiguous net effect on total funds at school level due to abolition of local fundraising.

2. **Changes in the pool of students**
   - Fees are abolished so more children can access education.
   - Of course, these children may be different from existing students in terms of socio-economic background, age, ability, etc.

3. **Increased centralization ⇒ loss of local accountability**
   - SMCs no longer raise funds for the school, thus their governance power is undermined
   - Parents no longer pay for the school, so may lose sense of ownership
   - Authority over hiring and firing, etc. is held by Ministry, with little information on school management.
Theoretical Mechanisms at Work under FPE

Data sources: Household survey data

We combine data from two household surveys, one prior to and the other following the introduction of FPE.

**WMS**
- 10,874 households nationwide
- 13,639 children age 6 to 13

**KIHBS**
- 13,212 households nationwide
- 14,610 children age 6 to 13

**Overlap**
- Socioeconomic indicators: household consumption, assets, education of HH head
- Children’s current enrolment status, grade level, school type
- Expenditure on education, fees and other categories
Data sources: Administrative data

School level data comprises a census of all primary schools in Kenya, spanning the period before and since FPE.

**KNEC**
- Kenya National Examinations Council
- Administers the Kenya Certificate of Primary Education (KCPE) exam
- Test covers English, Kiswahili, math, science, history, art and business

**EMIS**
- Education Management Information System, run by the MoE in collaboration with the Teacher Service Commission
- Panel of schools from 1998 to 2005, averaging just over 15,000 schools per year
- Includes data on enrolment by grade, age and sex
- Teacher level data with experience and qualifications

  FPE and the market for private schooling
  Has FPE reduced inequality in educational attainment?

Achievement

Conclusions
How has household educational expenditure changed?

We begin by looking simply at the cost of schooling in Kenya before and after FPE, distinguishing between fees and other expenditures, and emphasizing the contrast between the public and private system. We estimate these costs as follows:

$$E_{it} = \beta_P P_{it} + \beta_S Sec_{it} + \beta_{Pt} P_{it} T + \beta_{St} Sec_{it} T + \beta_t T + \epsilon_{it}$$  \hspace{1cm} (1)$$

where $E_{it}$ is a measure of education expenditure for household $i$ in period $t$, $P_{it}$ and $Sec_{it}$ measure the number of household members enrolled in primary and secondary education respectively.

Has FPE reduced inequality in educational attainment?

To answer this question we look at whether the relationship between socio-economic indicators and enrolment status has weakened since the introduction of FPE. Using the KIHBS and WMS data, we estimate:

\[ S_{it} = \gamma_0 + \gamma_x X_{it} + \gamma_{xt} X_{it} T + \gamma_t T + \mu_{it} \]  

(2)

where \( S_{it} \) is an indicator of enrollment for child \( i \) in period \( t \), \( X_{it} \) is a vector of observable child, parent and household characteristics, \( T \) is a dummy taking a value of one after the onset of FPE and \( \mu \) is an i.i.d. error term.

Background and Motivation
Kenya’s education system
Hypotheses
Data sources

Enrolment
FPE and the market for private schooling
Has FPE reduced inequality in educational attainment?

Achievement

Conclusions
Summary of findings

Cost
- Since FPE fees for public primary have fallen to zero, and total costs nearly halved.
- Cost of private education has more than doubled, now more than 20 times more expensive than public ed.

Enrol.
- Inequality in education access has declined by our preferred measure.
- However, enrolment rates for public schools have actually declined, as poor students come in, richer students have fled to private schools in greater or equal measure.

Perf.
- Net effect is an accelerated decline in the average socio-economic status of public school students.
- Coincides with a rise in teacher-pupil ratios (due to hiring freeze + influx of overage students)
- Large performance gap between private and public schools.
- Flight to private schools associated with fall in public school performance.
