

Contribution of poultry production sectors to total production

The adjacent map depicts the contribution of poultry (sub-) sectors 1 to 4, as defined previously, to regional poultry production. In the Southeast, nearly half of poultry produce stems from farms classified as S1 while in the Mekong river delta S2 farms provide almost half of the regional production. In the Red river delta, the region with the highest overall production, around one half of poultry production comes from S1 and S2 farms. In the Northeast, which produces almost as much poultry as the Red river delta, S4 and S3 account for more than three quarters of poultry production, similar to what can be observed in the remaining regions.
