The Inter-Regional Inequality Facility was initiated in 2004 to promote inter-regional dialogue and knowledge sharing on MDGs and inequality.

Institutions participating in the Inter-Regional Inequality Facility include:
- African Development Bank
- African Union Commission
- Asian Development Bank
- Inter-American Development Bank
- New Partnership for Africa’s Development
- United Nations Economic Commission for Africa

This series of Policy Briefs summarises the experiences of recent government initiatives aimed at addressing inequality in Africa, Asia and Latin America.

Current Policy Briefs in the series:
- Social grants, South Africa
- Familias en Acción, Colombia
- Red de Protección Social, Nicaragua
- Programme for Advancement through Health and Education, Jamaica
- Social safety nets, Indonesia
- Mahatma Gandhi National Rural Employment Guarantee Scheme, India
- National Employment Fund, Tanzania
- Youth Training, Argentina and Chile
- National Functional Literacy Program, Ghana
- Universal Primary Education, Uganda
- Upgrading educational opportunities for the poor, Sri Lanka
- Health insurance for the poor, India
- Affirmative action, Malaysia
- Affirmative action, India
- Affirmative action, Nigeria

Inter-Regional Inequality Facility

February 2006

South Africa

Objectives

Since 2000, levels of investment and economic growth in South Africa have achieved their fastest increases in decades. Nevertheless, with an official unemployment rate of 26%, a poverty rate estimated at approximately 50%, and one of the most severe measures of inequality in the world, South Africa faces substantial challenges in addressing poverty, inequality and unemployment. While it ranks as an upper-middle income country based on average income, some of the nation's social indicators are comparable to those of the poorest countries of the world.

South Africa's social security system is the government's chief initiative in tackling these problems. It has two main objectives. The first is to immediately reduce poverty among groups who are not expected to participate fully in the labour market, and therefore vulnerable to low income: the elderly, those with disabilities, and children. The second objective is to increase investment in health, education and nutrition, so as to increase economic growth and development. These twin objectives are reflected in the Government's 1997 White Paper on Social Development, which states that "a social security system is essential for healthy economic development, particularly in a rapidly changing economy, and will contribute actively to the development process. It is important for immediate alleviation of poverty and is a mechanism for active redistribution."

Description

There are five major social security grants in South Africa: the State Old Age Pension, the Disability Grant, the Child Support Grant, the Foster Child Grant and the Care Dependency Grant. Eligibility for each grant is dependent on an income-based means test. The grants are financed through general tax revenues, collected on a national basis. The amounts paid have increased significantly in real terms since 2001, while the coverage of the Child Support Grant has expanded, from all children below seven years to all children below fourteen years.

The grants are implemented and administered by a separate national government agency, the South African Social Security Agency. In 2003, approximately seven million South Africans, out of a total population of 45 million, received one of these grants. Total spending in 2004/05 amounted to ZAR42 billion (approximately US$7 billion), which represented 10.2% of total government spending, and 3.1% of GDP.

Lessons learned

The effectiveness of South Africa’s social security system, in terms of targeting and benefitting poor households, is widely recognised. A number of complementary factors have contributed to its success. These include a President who recognises their importance and actively supports appropriate policy, a Social Development Minister who effectively champions their effective implementation and extension, and a well mobilised civil society that continually pushes government to move further. Current discussions focus on the case for a universal social grant available to all South Africans, called the Basic Income Grant, which would eliminate the income means-test and, it is argued, increase still further levels of take-up among the poorest households.

Eligibility for social grants is currently dependent on an income-based
means test, which varies according to the grant, the marital status of
the beneficiary, and other characteristics. For example, to qualify for
the SOAP, an individual must have an income lower than R1,226 if
single, and an income lower than R2,226 if married (2000 figures). The
grants are financed through general tax revenues, collected on a
national basis.

There are no explicit conditionalities associated with the social
grants, unlike a conditional cash transfer programme. Nevertheless,
to qualify for the CSG, parents must provide proof of immunisation
where such services are available, and proof of efforts to secure
employment or to join a development programme. In addition, if one
parent is no longer living with the custodial parent and child, the
custodial parent must provide proof of efforts to obtain private
maintenance from the other parent.

The broad features of social grants in South Africa have not changed
significantly since the current system was introduced. However, the
scope of the CSG was expanded, in 2002, from all children below the
age of seven to all children below the age of 14. In addition, since
2000 the enforcement measures used to determine household
eligibility for grants have become less burdensome on beneficiaries,
particularly with the CSG.

Implementation

Initially, provincial governments were responsible for the imple-
mentation and administration of social grants. However, a Govern-
ment review identified a number of problems associated with
provincial administration, including fraudulent grants, delays in
approving grant applications, and difficulties in accessing payment. In
2004, therefore, a national government agency was established to
implement and administer social grants, the South African Social
Security Agency (SASSA). This has a national office, and the provincial
structures are under development. The SASSA is in turn monitored
and evaluated by the national Department for Social Development
(DSD).

Until 2004, finance for social grants was allocated to provinces
through unconditional block grants, for disbursement primarily
through contracted private companies. In 2004, the National Treasury
revised this arrangement so that grants are paid through conditional
grant-managed by the DSD. The grants themselves are paid either in
cash at specified pay points, or directly deposited into a beneficiary’s
bank account. However, given high costs of personal banking, and low
rates of bank access for the poor, in practice most grants are paid out
directly in cash.

Ongoing evaluation of the social security system has involved diverse
stakeholders, including the Monitoring and Evaluation Unit and
Economics and Finance Directorate in the DSD, the National Treasury,
civil society institutions and research institutes. The evaluation
techniques vary, and include auditing the beneficiaries, surveying the
population to identify gaps and problems, and analysing national
household surveys.

Impact

In September 2003, 6.8 million people, out of a total population of 45
million, received some form of social grant. This included 2.0 million
adults receiving the SOAP, 1.1 million adults receiving the DG, and 3.7
million children receiving the CSG, FCG or CDG.

Total spending in the fiscal year 2004/05 amounted to R43 billion
(approximately US$7 billion). This represented 10.5% of total
government spending, and 3.1% of GDP. The government has steadily

Background

The historical approach to social security in South Africa has been one
of meeting the needs of the white minority. Social security for the
elderly began with the Old Age Pensions Act of 1928, which explicitly
excluded most black South Africans. In 1937 a disability grant was
extended on the same racial basis. In the late 1930s and 1940s, the
social security system was extended more broadly, but with racially
differentiated benefit levels. Even by 1987, child support grants to
blacks remained a small fraction of the size awarded to whites.

In 1994, therefore, the first democratically elected government in
South Africa inherited a fragmented social security system rooted in a
concern for the interests of the apartheid constituency. The challenge
faced by the government was to give meaning to the mandate in the
new Constitution, that “everyone has the right to have access to social
security, including, if they are unable to support themselves and their
dependants, appropriate social assistance” (1996 Constitution of the
Republic of South Africa, Section 27, 1c). At the same time however,
the levels of benefits previously provided to the white minority were
such that they could not be universalised in a fiscally sustainable
manner.

Details

South Africa’s social security system is a system of targeted social
grants. The current system was implemented and reformed in stages,
adapted from the legacy of programmes inherited by the incoming
government.

There are currently five main types of social grant. The first is the State
Old Age Pension (SOAP), which provides support to men over 65 and
to women over the age of 60. The second is the Disability Grant (DG),
which provides support to adults with disabilities. The third is the
Child Support Grant (CSG), which provides support to families with
children under the age of fourteen. The fourth is the Foster Child
Grant, which provides support to families with children, below the age
of 18, in foster-care. The fifth is the Care Dependency Grant, which
provides support to families with children, below the age
of 18, with disabilities.

increased spending on social grants, in both nominal and real terms. In 2000/01, spending amounted to R8 billion (approximately US$3 billion), which represented 2.0% of GDP. By 2006/07, the National Treasury projects nominal spending to increase to R9.4 billion (approximately US$9 billion), and 3.4% of GDP.

Results from the South African Labour Force Survey show that the social security system performs well in terms of targeting accuracy. Table 2 shows estimates of ‘type I’ targeting error associated with the SOAP, DG and CSG: the percentage of eligible individuals (i.e. pensioners, adults with disabilities, or children under fourteen) in poor households who did not receive each benefit. (Poor households are defined here as those that spend less than R700, approximately US$130 per month).

Looking first at national averages, levels of type I error are either low, as with the SOAP (around 10%), or have declined significantly in recent years, as with the CSAs and the DG (from 91% to 43% and from 84% to 55% respectively). In terms of the various provinces, levels of type I error are generally close to the national average, although there are certain exceptions. Gauteng province, for example, has a much higher level of type I error (relative to the national average) with the SOAP, while Limpopo has a much lower level (relative to the national average) with the CSAs. However, the amount of type I error for each grant fell in all provinces from 2000 to 2004, and in virtually all cases substantially so. Levels of type II error are also relatively low, with less than one-fifth of each grant being paid to households with income above the poverty line.

Factors contributing to success

Political commitment

President Thabo Mbeki’s unequivocal commitment sent a clear message to the bureaucracy that social grants provided the central pillar for the poverty alleviation strategy. In the 2002 State-of-the-Nation Address, he announced a government-led campaign to “register all who are eligible for the child grant”, and in 2003 reinforced his support for the ongoing effort by publicly thanking all those “who had rolled up their sleeves to lend a hand in the national effort to build a better life for all South Africans”, citing first the “campaign to register people for social grants”. The system has also benefited from a Social Development Minister, Dr. Zola Skiewycy, who has effectively championed the effective implementation and extension of social grants within the Cabinet.

The Government has also been influenced by the Committee of Inquiry into Comprehensive Social Security (CICSS) – so-called Taylor Com-mittee, named after its chair-person, Professor Vivienne
Taylor – which examined the shortcomings of social security in South Africa. Following the government’s acceptance of the report, the DSD extended the Child Support Grant from age seven to age fourteen, doubling its scope.

Civil society has been another important political force behind the implementation of the social security system. The Anglican Archbishop of Cape Town, Njongosuka Ndingane, has forcefully argued in favour of social assistance for all South Africans, as has the General Secretary of the labour union federation, Zwelenzima Xavi. A particularly effective non-governmental organisation – the Black Sash – maintains advice offices for the poor throughout the country, providing information and support that enables eligible individuals to access their social grants. A lawsuit co-ordinated on behalf of the poor successfully persuaded government to pay billions of rand in back payments to the poorest in the country.

International support

Strong research efforts have also contributed to the success of South Africa’s social grants. Two international researchers—Dr. Claudia Haarmann and Dr. Dirk Haarmann—provided the initial analysis that organised labour used at the 1998 Presidential Jobs Summit, which advocated social grants. The socio-economic security project of the International Labor Organisation (ILO), under the leadership of Dr. Guy Standing, provided important support to the CICSS and subsequently to civil society organisations mobilising for increasingly effective social security. Nevertheless, the design and financing of social security in South Africa has been a primarily domestic phenomenon.

Country characteristics

South Africa has one of the highest levels of measured income inequality in the world. A high degree of initial inequality creates a situation whereby those individuals in the upper end of the income distribution can afford the taxes required to pay for social grants. It is not therefore surprising that some of the most effective income transfer programmes are in countries like Brazil, Namibia and South Africa that are also characterised by some of the highest rates of measured income inequality. The South African macro-economist context has also contributed to the success of the system, in particular, the existence of substantial excess productive capacity enables the demand-increasing effects of social security to be met with an effective increase in supply with little if any inflationary impact.

Lessons learned

South Africa’s experience with social security has provided important lessons for countries concerned with eradicating poverty and reducing inequality. Research has identified social grants as effectively targeted, and as the most pro-poor item of government expenditure. Furthermore, social grants not only provide households with income, they also support second-order effects that further reduce poverty. In particular, households that receive social grants are more likely to send young children to school, provide better nutrition for children, and look for work more intensively, extensively and successfully than do workers in comparable households that do not receive social grants.

Nevertheless, there are still areas where policy-makers and analysts need to know more. Relatively little is known about the link between government social grants and the private social safety net (private remittances), and the amount by which government grants “crowd out” the private safety net. Relatively little is also known about the differential impacts of social grants, by gender and across spatial areas, or on their effects on labour migration. Finally, a clearer picture of how social grants affect households, as well the differential impacts across regions and households, could be obtained through the use of panel data analysis, as has been done in other countries.

Finally, a key obstacle in the implementation of the social security system since 1994 has been the means-test. Surveys of provincial departmental officers responsible for the means test have identified contradictory interpretations of the test, undermining efforts at uniform delivery standards. The administrative requirements associated with the test are also generally thought to be the main barrier to greater take-up of social grants among poor households. This is particularly so in the poorest rural areas, where the poor have the least access to the official identification documents necessary to access social grants. It has also been argued that the income test discriminated against households with a large number of dependants.

In response to the problems associated with the means-test, the Taylor Committee recommended the introduction of a universal grant to all South Africans, termed the Basic Income Grant. This would be set app-roximately at the size of the existing CSG, and introduced in a phased manner, beginning with the extension of the CSG to all children aged under 18. No means test would be required: everyone in the country, rich and poor, would receive the grant, which would therefore act like a tax rebate for upper-income recipients. The universal character of the grant would, it is argued, economise substantially on the government’s scarce administrative resources, while at the same time eliminating the econo-mic costs arising from the distortionary nature of the means-test. The scheme has been advocated widely by civil society groups, and also by the Minister for Social Development, who declared (following initial work-shops organised by the Taylor committee), that “a Basic Income Grant system is one of the excellent ideas we might consider introducing”.
