## Notes

---

### General

These are additional tables produced to as a supplement to the UK Tri-Service Families Continuous Attitude Survey Results 2017. These statistics have been derived from the Families Continuous Attitude Surveys (FAMCAS) from 2015 - 2017. These tables aim to better understand the impact of mobility on Service families: they compare results between families who moved for Service reasons and families who did not move. Results are only available from 2015 onwards due to changes made to the question about moving home in 2015.

The 2017 FAMCAS report can be found on GOV.UK:

[www.gov.uk/government/statistics/tri-service-families-continuous-attitude-survey-2017](http://www.gov.uk/government/statistics/tri-service-families-continuous-attitude-survey-2017)

### Technical notes

#### Significance Testing

Tables of results are produced using SPSS Complex Samples to ensure estimates and their corresponding standard errors are correctly weighted. Where year on year comparisons are possible, Z-tests at the 99% confidence level are carried out.

Survey estimates (percentages) accompanied by \*\* in the statistical tables indicate that the difference between that year's estimate and the 2017 estimate is statistically significant. Where a previous year's survey estimate is not annotated with \*\* this indicates that not enough evidence has been found of a statistically significant difference between the percentage estimate for that year and the 2017 percentage estimate.

Survey estimates (percentages) accompanied by ^ in the statistical tables indicate that the difference between the 2017 estimate for those who moved for Service reasons and the 2017 estimate for those who did not move is statistically significant. Where a 2017 survey estimate for those who moved for Service reasons is not annotated with ^ this indicates that not enough evidence has been found of a statistically significant difference between the two 2017 estimates.

Where the survey estimate is exactly 0% or 100%, standard errors are not possible and therefore significance tests are not carried out.

Note that significant increases do not necessarily refer to an improvement. A significant increase in dissatisfaction, for example, is unlikely to be considered an improvement.

#### Margin of Error

Each estimate carries a margin of error and these are presented in corresponding tables. Margins of error enable users to observe the level of uncertainty in the estimate. Broadly speaking, a larger margin of error corresponds to a greater degree of uncertainty. Large error margins are usually the result of having a small number of respondents within a particular group. Where the margin is larger, users should interpret such results with caution.

### Symbols and conventions

.. denotes not available  
\*\* denotes the estimate is significantly different to the 2017 estimate (99% confidence level)  
^ denotes the estimate is significantly different to the "Not moved" estimate (99% confidence level).  
|| denotes a break in time series comparisons i.e. it is not possible to compare to previous years.

Estimates for groups with fewer than 30 respondents are not presented in this report.
