

Farming Statistics Final Land Use, Livestock Populations and Agricultural Workforce at 1 June 2014 - England

This release contains the final estimates of crop areas, livestock numbers and the agricultural workforce on commercial agricultural holdings in England on 1 June 2014. This release has been updated to include land ownership, poultry, horse, goat, farmed deer and camelid populations, and the size of the agricultural workforce. Crop areas and populations of cattle, sheep and pigs remain unchanged to those published on 18 September 2014.

Approximately 30 thousand commercial holdings were asked to complete the survey and results are based on 20 thousand responses, representing a response rate of 67%. Commercial holdings are those farms with a significant level of activity. A full definition can be found in the methodology section on page 17. The key results are given below.

Agricultural land use and ownership ([Tables 1-2](#))

- The utilised agricultural area (UAA) in England remained almost unchanged between 2013 and 2014 and stands at 9.0 million hectares.
- The total croppable area accounts for just over half (54%) of UAA and decreased by 0.8% to 4.8 million hectares in 2014.
- Permanent grassland accounts for an additional 42% of UAA and was 3.7 million hectares in 2014, virtually unchanged since 2013.
- The area of owned land in England increased by 0.5% to just over 5.8 million hectares in 2014. Land rented in for a year or more decreased by 2.2% to just under 3.1 million hectares.

Crops ([Tables 3-6](#))

- The June arable crop areas show large changes between 2013 and 2014. Last year's terrible weather conditions left many farmers unable to plant winter sown crops. Failed crops due to pests and water-logged fields also contributed to the changes seen between crop categories in 2013. This resulted in some farmers planting spring sown crops instead of winter crops and others leaving more arable land out of production.
- As a result of improved weather conditions this year, farmers have been able to once again plant crops on land that had to be left out of production in 2013. This has led to a 38% decrease in the area of uncropped arable land which fell from 237 thousand hectares in 2013 to 146 thousand hectares in 2014.

You can also find National Statistics on the internet at www.statistics.gov.uk.

- The area of land used for cereal crops saw a 5.7% increase in 2014 and now stands at 2.6 million hectares. The ratios between winter and spring sown crops have also returned to more typical levels seen prior to 2013.
- The area of horticultural crops was little changed this year and accounts for 139 thousand hectares of land.

Livestock ([Tables 7-11](#))

- The total number of cattle and calves in England is just under 5.4 million in June 2014, showing little change since 2013. The total breeding herd increased by 1.1% to almost 1.9 million in 2014. This was due to a 2.6% increase in the dairy herd which now stands at just over 1.1 million. The beef herd decreased by 1.3% to 710 thousand.
- The total number of pigs in England decreased by 2.8% to just under 4.0 million animals in 2014. Breeding and fattening pigs both saw decreases in 2014 falling by 5.3% and 2.5% respectively.
- The total number of sheep and lambs increased by 3.1% from 14.9 million in 2013 to 15.4 million in 2014. The female breeding flock remained almost unchanged at 7.1 million whereas the number of lambs increased by 6.5% to 7.9 million.
- The total number of breeding and laying fowl in England decreased by 2.0% between 2013 and 2014 to 32.7 million. The number of table chickens (broilers) increased by 7.4% to 82.7 million.
- In 2014 the number of horses and goats on commercial holdings increased by 5.7% and 2.1% respectively. Farmed deer decreased from 22 thousand in 2013 to 21 thousand in 2014.

Agricultural workforce ([Table 12](#))

- The total number of people working on agricultural holdings in England increased by 2.1% from 296 thousand in 2013 to 302 thousand in 2014. This was largely due to a 9.8% increase in the number of casual workers, which stands at 43 thousand people in 2014.

Survey methodology ([Pages 17-18](#))

For information on how the survey is run and details of data analysis and accuracy of results please see the methodology section on pages 17 and 18 at the end of this release.

Other surveys and next publications due ([Page 19](#))

Further information on the next publications due from the results of the June Agricultural Survey can be found on page 19. This includes both England and UK publications.

Defra is extremely grateful to the many farmers who complete the June Survey questionnaire each year. The support of farmers enables the Department to produce timely figures on the latest trends which are important for the Department's business and the industry's market operations.

Detailed results

Utilised agricultural area

The utilised agricultural area includes all arable and horticultural crops, uncropped arable land, land used for outdoor pigs, temporary and permanent grassland and common rough grazing. The total utilised agricultural area in England remained almost unchanged between 2013 and 2014 and stands at 9 million hectares.

Figure 1: Total utilised agricultural area at 1 June 2000 to 2014

Figure 1 shows that the utilised agricultural area in England has remained stable around the 9 million hectare mark since 2000. The small drop seen between 2008 and 2009 is a result of register improvements made ahead of the 2010 Census which removed holdings that no longer have agricultural activity.

Croppable area

The area of land available for cropping decreased by 0.8% to just over 4.8 million hectares in 2014. The croppable area consists of cereals, oilseeds, potatoes, other arable crops, horticultural crops, uncropped arable land and temporary grassland.

Figure 2: Total croppable area at 1 June 2014 compared to 2013

Figure 2 on the previous page shows that on the whole the proportion of croppable land used for each purpose remained similar between 2013 and 2014; however some categories did see large value changes. In particular the area of uncropped arable land fell by 38% to 146 thousand hectares. This followed a large increase in area in 2103 when many farmers left land uncropped as a result of the terrible weather conditions. In 2014 the improved weather conditions meant many farmers have once again been able to plant crops on land previously left out of production.

Cereals and oilseeds

As mentioned above the difficult weather conditions in 2103 saw many farmers either leaving land out of production or planting spring sown crops instead of winter sown crops when possible. This year has seen a return to areas more consistent with previous years, before the large changes seen in 2013.

With the improved weather conditions the area of cereal crops increased by 5.7% to 2.6 million hectares in June 2014. However the area of oilseed crops decreased by 9.1% from 714 thousand hectares in 2013 to 648 thousand hectares in 2014.

Figure 3 shows that the area of wheat has fluctuated between approximately 1.5 and 2.0 million hectares over the past 30 years. After the difficulties last year the wheat area recovered in 2014, increasing by 19% to 1.8 million hectares. Wheat continues to be the most popular crop grown in England.

The total barley area also saw a large change in 2014, decreasing by 14% from 828 thousand hectares in 2013 to 709 thousand hectares. The overall fall in the total barley area was due to a 39% decrease in the spring sown area which more than offset the 41% increase in the winter sown area. Following the sharp changes seen in 2013 due to weather the ratio between winter and spring sown barley has returned to an almost 50/50 split in 2014. This is consistent with recent years prior to 2013.

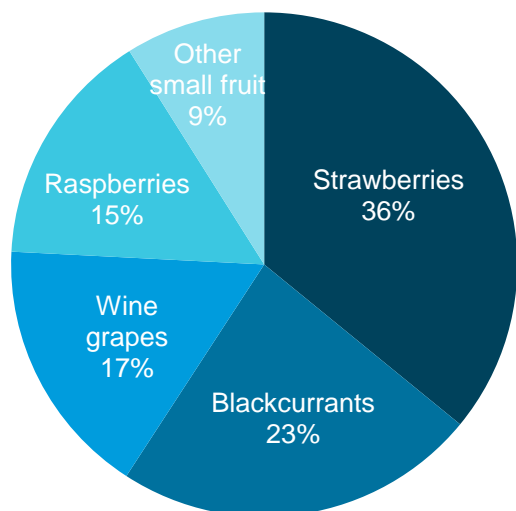

Figure 3: Area of wheat, barley and oilseed rape at 1 June 1984 to 2014

The total area of oilseed rape fell for the second year running, decreasing by 6.6% from 676 thousand hectares in 2013 to 632 thousand hectares in 2014. The spring sown area of oilseed decreased by 86%, however this was a return to a more typical area of 13 thousand hectares following the large increase seen in 2013. Conversely the area of winter sown oilseed increased between 2013 and 2014, rising by 5.9% to 618 thousand hectares.

Fruit and vegetables

Figure 4: Breakdown of small fruit as at 1 June 2014

The total area of orchards and small fruit was unchanged between June 2013 and 2014 at just under 30 thousand hectares. Orchards account for 72% of this total and cover 21 thousand hectares in 2014.

The remaining area of 8.5 thousand hectares is used to grow small fruit. Figure 4 shows the breakdown of small fruit areas in 2014. The largest proportion of the small fruit area is used to grow strawberries (36%) with blackcurrants being the next most common small fruit crop (23%).

The area used to grow vegetables for human consumption also remained virtually unchanged between 2013 and 2014 and stands at 98 thousand hectares. The majority (66%) of this area is used to grow other vegetables and salad. This area decreased by 2.5% to 64 thousand hectares in 2014. The second largest area is vining peas which increased by 5.5% and offset the fall in other vegetables and salad.

Cattle

The total number of cattle and calves in England remained almost unchanged between 2013 and 2014 and stands at just under 5.4 million animals. The female breeding herd accounts for just over a third of this total.

Figure 5: Female dairy and beef herds at 1 June 2005 to 2014

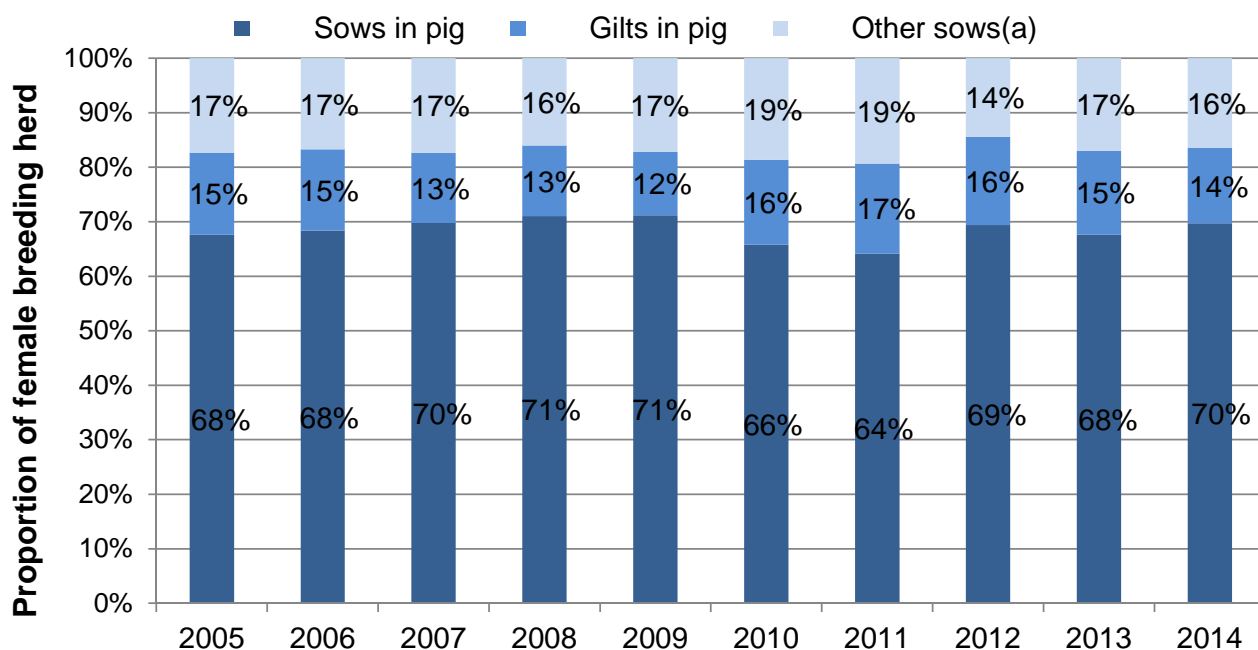

In recent years the breeding herd has been steadily decreasing from just over 2.0 million in 2005 to 1.8 million in 2013. However in 2014 the breeding herd increased by 1.1% to almost 1.9 million. The dairy herd accounts for 62% of the breeding herd and increased by 2.6% in 2014. The beef herd decreased by 1.3% from 720 thousand in 2013 to 710 thousand in 2014 (figure 5).

Pigs

The total number of pigs in England decreased by 2.8% from 4.1 million animals in 2013 to 4.0 million in 2014. This decrease was driven by a 2.5% fall in the number of fattening pigs which account for 90% of all pigs.

Figure 6: Breakdown of the female pig breeding herd 1 June 2005 to 2014

(a) Other sows are those either being suckled or dry sows kept for further breeding.

The female breeding herd decreased by 4.8% to 329 thousand pigs in 2014. Figure 6 above shows how the female breeding herd is made up. Other breeding pigs also decreased in 2014, falling from 88 thousand in 2013 to 82 thousand in 2014. The result was an overall decrease of 5.3% in the total number of breeding pigs.

Sheep

With better seasonal conditions, good feed availability and improved lambing rates, the total number of sheep and lambs in June 2014 is 15.4 million animals, an increase of 3.1% compared to June 2013. With a stable female breeding flock, the increase was largely due to the greater number of lambs, which rose by 6.5% to 7.9 million animals.

Poultry

The number of table chickens (broilers) increased by 7.4% from 77.0 million birds in 2013 to 82.7 million in 2014. Table chickens account for two thirds of all poultry in England and continued consumer demand for poultry meat helped to fuel their increase in number.

Conversely the total number of breeding and laying fowl in England decreased by 2.0% from 33.3 million birds in 2013 to 32.7 million in 2014. Hens and pullets laying eggs for eating account for the majority (78%) of the breeding and laying flock and decreased by 1.9% in 2014. This equates to a reduction of almost half a million birds.

The number of ducks and turkeys in England both saw reductions in 2014, decreasing by 17.1% and 7.9% respectively. The number of geese in England increased from 82 thousand in 2013 to 99 thousand in 2014.

Other livestock

In 2014 the number of horses and goats on commercial holdings in England both increased and now stand at 205 thousand and 82 thousand animals respectively. The number of farmed deer decreased from 22 thousand in 2013 to 21 thousand in 2014.

Agricultural workforce

The total number of people working in agriculture in England was 302 thousand in 2014, an increase of 2.1% since June 2013. Farmers, business partners, directors and spouses increased by 1.2% to 174 thousand in 2014 and account for over half (58%) of the total workforce. Salaried managers make up a much smaller proportion of the total (4%) and remained almost unchanged at 11 thousand people in 2014.

Regular employees and casual workers make up the remainder (39%) of the total workforce. Full time and part time regular workers both remained stable in 2014 at 47 thousand and 28 thousand people respectively. As might be expected the number of casual workers in agriculture can vary greatly due to weather conditions, cropping areas, harvest timing and numerous other factors. In June 2014 the number of casual workers increased by 9.8% to 43 thousand people. This followed the drop seen last year as a result of terrible weather causing large areas of land to be left uncropped in 2013.

Results tables

(a) Includes all arable and horticultural crops, uncropped arable land, common rough grazing, temporary and permanent grassland and land used for outdoor pigs (excludes woodland and other non-agricultural land).

(b) This area is an estimate of total common land in England. The vast majority is eligible for grazing and claimed upon under the Single Payment Scheme (SPS) but isn't necessarily used for grazing. The area was last revised in 2011.

(c) Includes all arable land not in production, including GAEC12 land, game strips, wild bird and game cover.

(d) Classified as mountains, hills, heathland or moorland.

Male	30	22	28	27.3	+/- 1.3	✓✓✓
Female	15	17	15	-12.5	+/- 1.3	✓✓

(a) Part time is defined as working less than 39 hours per week.

Survey methodology

Full details of the survey methodology are available on the website at: <https://www.gov.uk/structure-of-the-agricultural-industry-survey-notes-and-guidance>. A summary is given below.

The June Survey of Agriculture and Horticulture was historically a postal survey run annually. However from 2011 onwards, the survey has been run predominantly online with an option for farmers to complete a paper form if they preferred.

Approximately 30 thousand 'commercial' holdings were asked to complete the survey in 2014. Commercial holdings are defined as those with significant levels of farming activity, i.e. holdings with more than five hectares of agricultural land, one hectare of orchards, 0.5 hectares of vegetables or 0.1 hectares of protected crops, or more than 10 cows, 50 pigs, 20 sheep, 20 goats or 1,000 poultry.

Checks were carried out to ensure the sample was representative across farm size. The size of a farm is determined by its Standard Labour Requirement (SLR). In the SLR system, each livestock type and land-use has a theoretical amount of labour required each year. This value is multiplied by the land area or livestock numbers and then summed to give the SLR for the holding. The SLR represents the typical number of full time workers required on the holding.

The small farms (those with low SLRs) were sampled at a lower rate and the sampling rate increased with farm size as in table 13 below. This method minimises the burden on farmers whilst maximising the coverage. To improve the coverage of the pig and poultry sectors, a special data collection exercise was run to collect data from a central point for some of the largest companies.

Table 13: June 2014 sample design

Stratum	Description	Sampling rate (%)	Population size
1	SLR < 0.5	13	45 383
2	SLR >= 0.5 and < 1	18	14 945
3	SLR >= 1 and < 2	30	15 903
4	SLR >= 2 and < 3	45	8 853
5	SLR >= 3 and < 5	65	7 972
6	SLR >= 5	78	7 724
10	SLR unknown	35	4 232
All		28	105 012

The results in this statistical release are based on responses from just over 20 thousand commercial holdings, representing a response rate of 67%.

Cattle results are sourced from the Cattle Tracing System (CTS). The data include returns from all holdings with cattle so are not subject to survey error. More information on the use of this administrative data can be found on the “survey notes and guidance” web page via the following link:

https://www.gov.uk/government/uploads/system/uploads/attachment_data/file/182225/defra-stats-foodfarm-landuselivestock-june-results-BovineRegisters.pdf.

Data analysis

The data are subject to rigorous validation checks which identify inconsistencies within the data or large year-on-year changes. Any records that have not been cleaned by the results production stage are excluded from the analysis.

Population totals are estimated for each question on the survey to account for the non-sampled and non-responding holdings. This survey uses the technique known as ratio raising, in which the trend between the sample data and base data (previous year’s data) is calculated for each stratum. The calculated ratio is then applied to the previous year’s population data to give England level estimates. For holdings where we do not have base data (new holdings or long-term non-responders) the sample estimates are raised according to the inverse sampling fraction.

Confidence indicators

We calculate the standard error for all our estimated figures. The standard error is a measure of the variation in the data. Typically, large estimates also have large standard errors. The standard error divided by the estimated total gives the relative standard error (RSE). This is expressed as a percentage and is easier to interpret than the standard error. Low RSEs indicate greater reliability in the figures, whereas estimates with high RSEs should be treated with caution.

Tick based confidence indicators have been shown against the June 2014 figures, ranging from 3 ticks (good) to 1 cross (poor). The ranges relate to the relative standard errors (RSE) as follows:

- ✓✓✓ RSE $\leq 2.5\%$
- ✓✓ RSE > 2.5 and $\leq 5\%$
- ✓ RSE > 5 and $\leq 10\%$
- ☒ RSE > 10 and $\leq 20\%$
- ☒ RSE $> 20\%$

We have also shown confidence intervals against the figures. They are based on the standard error multiplied by 1.96 which gives a 95% confidence interval. We are 95% confident that this interval contains the true value. The standard errors only give an indication of the sampling error. They do not take into account any other sources of survey errors, such as non-response bias or administrative data errors.

Data notes

- All figures in tables 1 to 12 relate to commercial holdings only with the exception of the cattle figures in table 7, which relate to all holdings. Further details on commercial holdings can be seen in the methodology section on page 17.
- All percentage changes are based on unrounded figures.
- Totals may not necessarily agree with the sum of their components due to rounding.

Data uses and users

Results from the June Survey of Agriculture and Horticulture have a wide range of uses and users with requests for data being made on a daily basis. A document providing information of specific uses and users can be found via the following link:

<https://www.gov.uk/government/statistical-data-sets/structure-of-the-agricultural-industry-in-england-and-the-uk-at-june>.

Other survey results and publications

Results from all the Defra farming surveys can be viewed on the Defra website via the following link: https://www.gov.uk/government/publications?publication_filter_option=statistics. This also contains details of future publication dates.

The next Farming Statistics publications due from the June Survey of Agriculture and the Cereal and Oilseed Rape Production Survey are shown below. Please note that the publication dates are provisional and subject to change.

England Publications

- The next publications from the June Survey will relate to 2015 results. First early estimates of cereal, oilseed and uncropped arable land areas will be available in August 2015.

UK Publications

- 18 December 2014: Farming Statistics final crop areas, yields, livestock populations and agricultural workforce at 1 June 2014 – United Kingdom.

More detailed results from the June Survey can be found at:

<https://www.gov.uk/government/statistical-data-sets/structure-of-the-agricultural-industry-in-england-and-the-uk-at-june>. This includes various time series of crop areas and livestock numbers dating back as early as 1866 and detailed geographical breakdowns of the results.
