

I object most strongly to the proposals to build Nuclear Reactors at Wylfa and Oldbury for the following reasons:

1. UK taxpayers and energy users will have to pay the inflated strike price required if Hitachi seek and get a similar deal to EDF at Hinkley. This is grossly unfair and will no doubt adversely affect investment in safer, more sustainable renewable energy.
2. Japanese ABWR's have shown that such reactors' performances have been poor in reality. Has the Nuclear Industry Association made proper reference to poor performance by existing reactors of similar type to those proposed by Hitachi?
3. Based partly on evidence (such as the KiKK report published **before** Fukushima) Germany has decided to close all its Nuclear Reactors before 2022. The UK should not be building new reactors and should **seriously** review evidence, such as the KiKK report about community health issues connected to the locality of existing nuclear reactors, etc.
4. There are major issues for the island population of Wylfa if a major nuclear incident occurs at that site. Mass evacuation across 2 already congested road bridges (in summer and during rush hours) would be extremely difficult.
5. The population of Wylfa is mainly Welsh speaking and will be particularly badly affected by the huge influx of "foreign" workers onto their small island during construction.

I look forward to feedback about this consultation.

Yours faithfully

Beverley Draig
