# Mycophenolate mofetil (MMF)/mycophenolic acid (MPA): amended recommendations for contraception

Dear Healthcare Professional,

The Marketing Authorisation holders, in agreement with the European Medicines Agency (EMA) and the Medicines and Healthcare products Regulatory Agency (MHRA) would like to inform you of the following:

#### Summary

## Male patients - new advice

- The available clinical evidence does not indicate an increased risk of malformations or miscarriage in pregnancies where the father was taking mycophenolate medicines.
- However mycophenolate mofetil and mycophenolic acid are genotoxic and a risk cannot be fully excluded.
- Male patients of reproductive potential should be made aware of the potential risks of fathering a child. As a precautionary measure for male patients, it is recommended that the patients or their female partner use reliable contraception during treatment and for at least 90 days after stopping mycophenolate medicines.

Male patients planning to have children should be advised to discuss the implications of both immunosuppression and any prescribed medications on pregnancy with their doctor.

## Female patients – reminder

- The risk for women is unchanged. Mycophenolate medicines remain contraindicated in women of child bearing potential who are not using reliable contraception. These medicines are also contraindicated in pregnant women unless there are no suitable alternatives to prevent transplant rejection.
- For female patients of child bearing potential, **at least one reliable form of contraception** must be used before, during and for 6 weeks after stopping mycophenolate medicines. Two forms of contraception are preferred but not mandatory.

## Background on the safety concern

Mycophenolate, used to prevent transplant rejection, is a major human teratogen known to cause miscarriages and congenital malformation when used in pregnant women. Between 45% and 49% of cases of exposure to mycophenolate in the womb result in miscarriage, and between 23% and 27% result in malformations.

Mycophenolate medicines – both mycophenolate mofetil (MMF)<sup>1</sup> or mycophenolic acid (MPA)– are therefore contraindicated in women of child bearing potential not using effective contraception. Mycophenolate is also contraindicated in pregnant women unless there are no suitable alternatives to prevent transplant rejection. In addition, negative pregnancy tests are required before starting treatment (as described in the product information for these medicines).

<sup>&</sup>lt;sup>1</sup> MMF is a pro-drug of MPA

Following a recent in-depth review of non-clinical and clinical data regarding men fathering children while being treated with MMF and MPA, the European Medicines Agency (EMA) has updated its 2015 recommendations for MMF and MPA to prevent pregnancy.

Although the amount of mycophenolate present in semen has not been determined, calculations based on animal data show that the maximum amount of mycophenolate that could potentially be transferred to a woman is low and is unlikely to have any effect. However, mycophenolate has been shown to be genotoxic in animal studies at concentrations higher than the human therapeutic exposure levels, and the risk of genotoxic effects on sperm cells can therefore not be completely excluded. The available clinical evidence while reassuring is currently insufficient to determine the risks in humans, however this is being continually monitored.

The previous recommendation that male patients should use condoms in addition to their female partners using a highly effective contraception has now been removed from the product information. The recommendation is now that as a precaution sexually active male patients **or** their female partners should use contraception during treatment and for at least 90 days after stopping mycophenolate.

The risks for women are unchanged. Women of childbearing potential must use **at least one form of reliable contraception** before starting, during, and for 6 weeks after stopping treatment with mycophenolate unless abstinence is the chosen method of contraception. However, two complementary forms of contraception are preferred to minimise the risk of contraception failure.

#### Call for reporting

Please continue to report suspected adverse drug reactions (ADR's) to the MHRA through the Yellow Card Scheme. Please report all suspected ADRs that are serious or result in harm. Serious reactions are those that are fatal, life-threatening, disabling or incapacitating, those that cause a congenital abnormality or result in hospitalisation, and those that are considered medically significant for any other reason.

It is easiest and quickest to report ADRs online via the Yellow Cards website - <u>https://yellowcard.mhra.gov.uk/</u> or search for MHRA Yellow Card in the Google Play or Apple App Store.

Alternatively, prepaid Yellow Cards for reporting are available:

- by writing to FREEPOST YELLOW CARD (no other address details necessary)
- by emailing yellowcard@mhra.gov.uk
- at the back of the British National Formulary (BNF)
- by telephoning the Commission on Human Medicines (CHM) free phone line: 0800-731-6789
- or by downloading and printing a form

When reporting please provide as much information as possible, including information about medical history, any concomitant medication, onset, treatment dates, and product brand name.

#### **Company contact points**

Alternatively, suspected adverse reactions may also be reported to the Marketing Authorisation holders or their authorised distributor using the details provided below. If you have further questions or require additional information, please contact:
