

Composite log (Completion log)

This is a graphical log containing all the primary measurements in a wellbore.

As a minimum it will contain

- Well header data
- Primary well logs. The Composite Log should integrate the geological columnar section with selected petrophysical logs i.e. a lithology indicating log, a porosity log and a resistivity log.
- Geological zones
- Lithology core intervals
- Testing intervals
- Casing / liner seats

It will be produced, ideally, using the CDA recommended practice [CS5](#).
