

Dear Sirs,

I am not a stakeholder - but a British citizen in the post-peak-oil era.

I believe that a mistake has been made in recent years. Our biggest problem is that Britain URGENTLY requires new electricity-generating facilities. The mistake is to have squandered substantial amounts of government and tax-payer money on sponsoring wind-power projects, while doing little to bring forward the construction of the new nuclear plants.

The windpower projects don't generate a useful amount of electricity, while nuclear plants obviously do - and this is the crucial point which seems to have been overlooked by all politicians. We can no longer afford to play at political correctness and a 'green' image.

Similarly for the decarbonisation of coal-fired flu gases - while I'm not against it, it DOESN'T offer an immediate fix to what is soon to be an electricity crisis. It's a longer-term research subject.

Please let us recognise that there is one, and only one course of action which can put Britain back onto a safe and carbon-free reliable electricity supply, and that is to get those new nuclear facilities build right now.

Thank-you,

A large black rectangular redaction box covering the signature area.
