

Dear Sir/Madam,

I remain concerned that the Government is not addressing the future of generations. Resources, which are not recyclable should be banned for energy, because they will very soon be no longer available for future generations. The human race has been on earth for thousands of years, but with the present economic and consumerism situation we certainly are not planning for a very long future!

Renewable energy is the only option, solar use is the only sustainable one. I urge you to stop wasting money on nuclear, which with fossil power is still subsidised. Desertec (Sahara Desert using Concentrating Solar Power) is already being pursued by some, but it needs much more urgency from this Government, as if it was a war to prevent waste! 10GW to London using two 5GW cables costing less than a new M1 lane would solve a lot of problems quicker than 10 nuclear power station buildings. As the cost of nuclear rises due to others having the same idea, CSP costs will come down with the greater number of units produced and the sun is infinitive.

Yours faithfully,

Dr. Peter Foreman, FIET.
