**Part 7 Monitoring the outcome of the adaptation programme**

# Climate Change Adaptation Plan

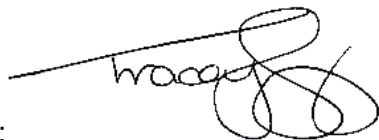

## Executive Summary

Author:

Date: 15-01-2011

Approved:

Date: 18-01-2011

## **Executive Summary Index**

- 1. Information on the organisation**
- 2. Business preparedness before Direction to report was issued**
- 3. Identifying risks due to the impacts of climate change**
- 4. Assessing risks**
- 5. Uncertainties and Assumptions**
- 6. Addressing current and future risks due to climate change**
- 7. Barriers to implementing the adaptation programme**
- 8. Reporting and Review**
- 9. Recognising opportunities**
- 10. Further information for the assessment of this plan**

# 1. Information on the Organisation

## 1.1. Functions, mission aims and objectives affected by climate change

- Bournemouth and West Hampshire Water (BWH) provide clean drinking water to about half a million people in an area from the outskirts of Poole to Southampton Water and from Bournemouth to just South of Salisbury. We supply approximately 184,000 households and 16,000 other properties, using a network of 2787km of water mains. We obtain up to 85% of our water from run of river abstractions on the Hampshire Avon and the Dorset Stour, and the remainder from boreholes. We do not treat wastewater; in our area the sewerage services are provided by Wessex Water and Southern Water. We have a long and successful tradition of supplying water.
- Our company strategy is to maintain our excellent record and to continue to improve our performance in response to customers' requirements.
- Our aim is to continue to be amongst the leading performers in the UK water industry by all measures, including sustainability, leakage, water quality, efficiency and customer service. We strive to position ourselves as a flagship organisation in order that our global shareholders can use us as a reference point for quality of service. By taking this approach we will benefit all our stakeholders both now and in the future.

## 1.2. Key strategic priorities for the business

- *Reliability of the water supply.* It is fundamental that we provide a reliable, value-for money water supply to all our customers, meeting all the obligations placed on us in providing an essential public service. In order to ensure that we maintain a reliable service we need to make sure that our business has the ability to adapt to future climatic impacts.
- *Drinking water quality.* Closely related to reliability, the water we supply must meet all the legal and regulatory standards of quality and safety.
- *Demand management.* An important focus for us is the application of a number of tools and techniques to manage demand, including the promotion of customer metering and water efficiency, and leakage control. By doing so we can postpone or avoid the need for new water resource development, which we acknowledge will be difficult in this locality because of the sensitivity of the water environment. For future planning we need to take into account the effects that the changing climate will have on the demand patterns of our customers.

- *Asset robustness and resilience.* In the face of climate change and similar uncertainties, we must ensure that all our assets are designed, operated and maintained in such a way to secure and protect the reliability and quality of the water supply. This may increase activity and expenditure in renewing and replacing water mains.
- *Sustainability.* By operating in a sustainable way today we will ensure those future generations will also be able to operate without compromising the quality of the service.
- *Cost reduction.* We have succeeded in reducing our costs of operation in recent years, and we will continue to strive to make efficiencies in future. This is likely to become more difficult in the face of rising cost pressures and increasing climatic variability.
- *Corporate governance.* It is essential that we operate to, and can demonstrate that we operate to, high standards of integrity, compliance and corporate governance. This principle applies to everything we do.
- *Price stability.* Our customers have told us that, with regard to pricing, they prefer stability to volatility. We will endeavour to achieve stability subject to the constraints of the price-setting mechanism, and any unforeseen new obligations.
- *Consistency and continuity.* We need to be consistent in delivering a good reliable service to our customers. They expect us to carry on undertaking our obligations in the same manner going into the future irrespective of the impacts of climatic variability.

## **2. Business preparedness before Direction to report was issued**

- Climate change risks constitute just one of many to the operation of a water company, we have faced risks from extreme climatic events in the past and will continue to do so in future We are an essential public service and therefore have to ensure that we can provide a service under all conditions, and as such have systems and procedures in place to deal with threats to our service.
- The hazards resulting from the climate change impacts assessed in this report are covered in the company risk register and Water Safety Plan. With regards to the management of company assets and resources we also refer to the company business plan and the Water Resources Plan both of which were compiled taking climate change impacts into account.
- In our climate change impact assessment we have not identified any additional risks over and above those already included in our strategic business planning. Therefore we have no need for immediate investment for adaptation outside of a small number of schemes already programmed in for the next AMP (asset management period) that deal with flooding of certain parts of water treatment works.
- The company risk register and water safety plans already hold a complete breakdown of all company risks and the controls in place to deal with these. We have linked the hazards from the highest scoring climate change impacts to those found in the company risk register and water safety plan.

### **2.1. How are these risks and any mitigating action incorporated into the operation of the organisation?**

- Building principles of sustainability and adaptability into the operation of our business ensures that we can achieve our goals of maintaining and improving service levels. As we have a corporate approach to risk identification and monitoring, we now review climate change related risks as part of the corporate risk management process.
- Table 2 below gives an outline of the mechanisms and processes we have in place to review risks in the corporate structure.

**Table 2**

| Level     | Process                                       | Frequency     | Comments   |
|-----------|---|---------------|--|
| Strategic | Formal review of risk register and actions    | 2 per year    | Formal process of review   |
| Strategic | Review of key standards and policy objectives | As necessary  | Based on political, regulatory and customer views                    |
| Company   | Business plan                                 | Every 5 years | Climate impacts to be taken into account for all business activities |
| Company   | Water Resource Plan                           | Annual        | Already takes climate change into account                            |
| Company   | Review of Water Safety Plan                   | Annual        | Climate change impacts to be included                                |

## 3. Identifying risks due to the impacts of climate change

### 3.1. Evidence methods and expertise used to evaluate climate change impacts

- These impacts have been assessed and identified from the Water UK study, A Climate Change Adaptation Approach for Asset Management (2007)<sup>1</sup>. The Water UK study was carried out by MWH consultants and provides water companies with a list of risks, impacts and associated consequences that will arise as a result of changing climatic conditions.

### 3.2. Resource assigned to this assessment

- This report was written and compiled by company staff and cost an estimated £25, 000.00 taking into account staff time and on-costs.

### 3.3. Summary of approach

- For the purpose of this report we have used expert judgement from within the company to evaluate how the various climate change risks and hazards will affect the areas of operation across the business for the time periods 2020, 2050 and 2080. These areas include Water Resources, Infrastructure, Water Quality and Corporate Services. The highest scoring risks from the initial qualitative risk assessment were then investigated in more detail and all the hazards identified were cross referenced to existing risk assessments on the company risk register and Water Safety Plan.
- The initial risk assessment was completed on all the risks highlighted in the Water UK study, these were analysed for the three time periods in the UKCIP 09 scenarios. We have assumed the future climatic conditions will follow the medium emissions scenario as set out by UKCIP 09.

<sup>1</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

---

## 4. Assessing risks

### 4.1. Quantifying the impact and likelihood of the risks occurring

- This report covers potential impacts for the time periods 2020's 2050's and 2080's with the greatest emphasis and certainty around those impacts identified for the 2020's this ensures that we are consistent with our Water Resources Management Plan and Company Strategic Direction Statement which is the company strategy for the next 25 years.
- As it has been pointed out the company aims to maintain or improve its levels of service. Our risk assessment takes into account the consequences for service in combination with the likelihood of that consequence occurring in the future. We apply this to all the impacts identified in the Water UK<sup>2</sup> study across all areas of operation.

### 4.2. Levels of Consequence

- We have based our levels of consequence on the corporate consequence matrix used in all areas across the business. Relevant experts across the company used the matrix found in table 4.2 to score all the climate change impacts that were highlighted in the Water UK study.

---

<sup>2</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

**Table 4.2**

| HARM ASSETS/SERVICES   | REPUTATION  | INTERNAL  | DAMAGE                                      | LOSS   | SCORE    |
|--|---|---|---|--|----------|
| Minor damage, extra repairs or maintenance   | -No impact on reputation                                | -Short run loss of a business system  | -Minor<br>-Few customer complaints          | -Minor<br>-£10K to £40K<br>-Loss of supply to 1 to 1K customers                            | <b>1</b> |
| Minor deterioration in assets  | -Minor local press release (one local paper)            | -Short run loss of supply   |   | -Loss of supply to 1K to 2K customers  | <b>2</b> |
| Deterioration of assets requiring substantial maintenance/replacement, change to investment plan | -Broad local press coverage (Most local papers & radio) | -Long run Loss of IT\Comms<br>- Fire in principle building<br>Major overheads for staff | -Major<br>-Multiple customer complaints     | -Major<br>-£40K to £100K<br>-Loss of supply to 2K to 5K customers                          | <b>3</b> |
| Major maintenance/replacement of assets, reduction of Security of supply                         | -National press coverage<br>-Local TV coverage          | -Unable to control business system<br>-Long run loss of business system                 |   | -Loss of supply to 5K to 10K customers<br>-National press coverage                         | <b>4</b> |
| Failure of service/asset   | -Long term loss of reputation                           | -Unable to control water supply<br>-Long run loss of water supply                       | -Catastrophic<br>- Undefendable prosecution | -Catastrophic<br>-£100K +<br>-Loss of supply to 10K+ customers<br>-Loss of BWHW reputation | <b>5</b> |

### 4.3. Likelihood score

- The likelihood of the company being affected by the various climate change impacts identified in the Water UK study are determined by assessing the most likely future climate scenarios for our area provided by UKCIP 09.

**Table 4.3 Likelihood**

| LIKELIHOOD         | Description  | Score    |
|--------------------|--|----------|
| Extremely unlikely | Almost no chance of occurring during the timeframe | <b>1</b> |
| Unlikely           | Low probability will occur during the timeframe    | <b>2</b> |
| Possible           | Medium probability will occur in the timeframe     | <b>3</b> |
| Likely             | High probability will occur in the timeframe       | <b>4</b> |
| Almost certain     | Almost certain to occur in the timeframe           | <b>5</b> |

### 4.4. Risk Score

- Impacts are scored and classified using table 4.4 below. Risk score = Level of consequence x Likelihood. The highest scoring risks are analysed in further detail in part 3 of this plan.

**Table 4.4 Risk Scores**

| Risk        | Score |
|-------------|-------|
| High Risk   | 15-25 |
| Medium Risk | 8-14  |
| Low Risk    | 1-7   |

#### 4.5. Confidence in the assessment

We use the table 4.5 below to assign a level of confidence to the assessment of risks.

**Table 4.5 Confidence in the assessment**

| Confidence in assessment | Analysis     | Attributes  |
|--------------------------|--------------|---|
| High                     | Quantitative | Experienced similar conditions in the past. High degree of certainty in predicted future conditions             |
| Medium                   | Qualitative  | Experienced similar conditions in the past. Medium level of certainty in predicted future conditions            |
| Low                      | Qualitative  | Conditions fall outside of those experienced in the past. Low level of certainty in predicted future conditions |

## 5. Uncertainties and assumptions

- We have a general idea of what conditions to expect however, projecting 50 plus years into the future presents us with a large degree of uncertainty.
- In order to get an idea of future conditions we have made a number of assumptions about future impacts facing the company.
- We acknowledge that these assumptions could change in light of new information and therefore we have mechanisms in place to allow for the assumptions used in this report to be reviewed and updated. This will ensure that we remain flexible and resilient to potential future hazards facing the organisation.

### 5.1. Main uncertainties in the evidence, approach and method used in the adaptation programme and the operation of the organisation

- The main uncertainties faced by the company are linked to the large variations in future climate scenarios and the robustness of data used to analyse the effects of climate on operations.

### 5.1.1. Evidence

- The impacts of climate change on the company have been taken from the Water UK study<sup>3</sup>. This provides general impacts for all water companies and therefore gives a broad range of possible impacts that could be experienced by a water company. Due to these impacts not being company specific there is a possibility that localised impacts could arise that have not been covered in the study.
- Data relating to the effects of climatic conditions on operations is not robust across all areas of the business. In future we need ensure that relevant data is collected in order to allow for more quantitative analysis.

### 5.1.2. Approach

- Our approach to climate change adaptation allows climate change risk to be managed through multiple interventions over time in some cases i.e. very long life assets a single intervention may be a better solution.

### 5.1.3. Method

- Our qualitative risk assessment has been carried out by relevant experts across the company. In future where possible we would like to use quantitative data to analyse climate related risks.

### 5.1.4. Operation of the organisation

- We are a small and local company compared to most other water which does increase operational risk slightly. Due to the small size of the company there are key staff members across the organisation that hold valuable information and expertise that is vital to the carrying out of our functions. This is especially the case when determining the effects of extreme weather on various areas of the business.
- Information needs to be recorded and stored in order that the organisation is less reliant on key members of staff. This plan will serve as a catalyst to improve the way operational data is stored and managed with regards to the effects of extreme weather.

---

<sup>3</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

## **5.2. Assumptions that have been made when devising the programme for adaptation**

### **5.2.1. The water industry**

- We assume that the water industry will exist in future in its current form with the same regulators and regulatory regime that we currently experience.

### **5.2.2. Emissions scenarios**

- Future climatic conditions will result from an atmospheric carbon content equal or less than the medium emissions scenarios provided by UKCIP. We assume that the government will achieve the targets set in the Climate Change Act 2008 to reduce emissions by 80% by 2050.

### **5.2.3. Levels of service**

- We will continue to maintain or improve our levels of service based on the wishes of our customers and key stakeholders.

### **5.2.4. Assessment of impacts**

- Assessments of impacts on areas of operation have been carried out by experts in those fields and their judgement of the impacts and effects constitutes the best possible information available at present.

### **5.2.5. Implementation of policies and procedures**

- We assume that the procedures we are putting in place to mainstream climate change adaptation into the everyday decisions and planning will be effective in achieving this end. We will review these procedures on a regular basis to ensure that climate change adaptation becomes integral to the operation of the business.

## 6. Addressing current and future risks due to climate change-summary

| Business Function | Climate variable | Primary impact of climate variable | Thresholds above which this will affect the organisation   | Likelihood of threshold being exceeded in the future (medium term 2020's) and confidence in the assessment | Potential impacts on organisation and stakeholders   | Proposed action to mitigate impact   | Timescale over which risks are expected to materialise and action is planned                         |
|-------------------|------------------|------------------------------------|--|--|--|--|--|
| Water Resources   | Drought          | Reduced availability of resource   | None identified in the medium term to be held under review (assessed in company Water Resource Plan) | Unlikely. Medium level of confidence in the assessment of this risk  | Reduced available supply. Changes in peak demands. Lower river levels. Lower groundwater levels. Lower yields from sources. Reduction in security of supply. Reduced borehole performance. | Company drought plan and Water Resources Management Plan   | Long term post 2050  |
|                   | Temperature rise | Increased demand                   | None identified in the medium term to be held under review (assessed in company water Resource Plan) | Unlikely. Medium level of confidence in the assessment of this risk  | Demand outstrips supply and changes in customer behaviour  | Company drought plan and Water Resources Management Plan   | Long term post 2050  |
|                   | Flood            | Surface flooding                   | None identified in the medium term to be held under review (assessed in company Business Plan)       | Unlikely Medium level of confidence in the assessment of this risk   | Loss of water resource assets. High intensity rainfall events causing reduced groundwater recharge due to compaction of upper layer of soil  | Assessed in company Business plan. Schemes in place in AMP 5 to mitigate risks to parts of treatment works under threat from surface flooding. | Medium term post 2020 Flood defence for vulnerable parts of treatment works to be completed in AMP 5 |
|                   | Sea level        | Inundation                         | None identified to be held under review  | Extremely unlikely Medium level of confidence in the assessment of this risk                               | Increase in the flood potential of rivers when high flows and tides coincide   | None at present impact will be kept under review   | Long term post 2050  |

|                |                  |                               |   |  |  |  |                       |
|----------------|------------------|-------------------------------|---|--|--|--|-----------------------|
|                |                  |                               |   |  |  |  |                       |
| Water Quality  | Drought          | Reduced raw water quality     | None identified to be held under review | Unlikely Medium level of confidence in the assessment of this risk             | Low flows leading to sedimentation and blockages. Reduced raw water volumes reducing dilution. Intermittent supply causing silts and debris being flushed from storage into the system. More inversions leading to greater cryptosporidium accumulation. Lower flow rates leading to deposition and reduced raw water quality. | None at present impact will be kept under review | Long term post 2050   |
|                | Temperature rise | Increased algal growth        | None identified to be held under review | Possible. Medium level of confidence in the assessment of this risk            | Increased algal growth and other biological issues   | None at present impact will be kept under review | Medium term post 2020 |
|                | Flood            | Reduced raw water quality     | None identified to be held under review | Unlikely Medium level of confidence in the assessment of this risk             | Increased runoff leading to higher sediment loads  | None at present impact will be kept under review | Long term post 2050   |
|                | Sea level        | Reduced raw water quality     | None identified to be held under review | Extremely unlikely. Medium level of confidence in the assessment of this risk. | Inundation   | None at present impact will be kept under review | Long term post 2050   |
| Infrastructure | Drought          | Increased burst mains         | None identified to be held under review | Unlikely. Medium level of confidence in the assessment of this risk            | Pipe failure due to de-pressurisation. Low river/groundwater below intake/pump levels  | None at present impact will be kept under review | Long term post 2050   |
|                | Temperature rise | Increased asset deterioration | None identified to be held under review | Unlikely. Medium level of confidence in the assessment of this risk            | Higher average and peak temperatures affect structures and buildings. Possible reductions in asset life and operational ability of assets. Ground movement leading to increased mains failures.  | None at present impact will be kept under review | Long term post 2050   |

|                    |                  |                               |  |  |   |  |  |
|--------------------|------------------|-------------------------------|--|--|---|--|--|
|                    | Flood            | Surface flooding              | Risks identified in the PR09 business plan to be held under review | Unlikely. Medium level of confidence in the assessment of this risk            | Loss of assets and service failure through direct flooding. Storm events leading to loss of power supply. Increased storm water leading to increased pump usage and accelerated deterioration. Higher flows posing risk to pipe bridges | Assessed in company Business plan. Schemes in place in AMP 5 to mitigate risks to parts of treatment works under threat from surface flooding. | Medium term post 2020 Flood defence for vulnerable parts of treatment works to be completed in AMP 5 |
|                    | Sea level        | Inundation                    | None identified to be held under review                            | Extremely unlikely. Medium level of confidence in the assessment of this risk. | Inundation of assets  | None at present impact will be kept under review   | Long term post 2050  |
| Corporate Services | Drought          | Financial                     | None identified to be held under review                            | Possible. Medium level of confidence in the assessment of this risk            | Financial impact of dealing with drought  | Company drought plan   | Medium term post 2020  |
|                    | Temperature rise | Working in extreme conditions | None identified to be held under review                            | Possible. Medium level of confidence in the assessment of this risk            | Working in extreme conditions   | None at present impact will be kept under review   | Medium term post 2020  |
|                    | Flood            | Access to sites               | None identified to be held under review                            | Unlikely. Medium level of confidence in the assessment of this risk            | Access to sites   | None at present impact will be kept under review   | Long term post 2050  |
|                    | Sea level        | Migration of population       | None identified to be held under review                            | Extremely unlikely Medium level of confidence in the assessment of this risk   | Migration of population   | None at present impact will be kept under review   | Long term post 2050  |

## **7. Barriers to implementing the adaptation programme**

Implementation of the climate change adaptation plan is essential if we are to ensure the resilience of our business. We have not at present identified any immediate actions that need to be carried out to deal with a risk to the business arising from climate change. Implementing the programme is a process of setting up mechanisms within the organisation that will allow for accurate monitoring and evaluation of the impacts of climate on the business and for this to be successful the following barriers will need to be overcome.

### **7.1. Behaviour change**

This report serves to highlight the areas where we could expect an impact in future. The significance of this is that we need to put in place measures to ensure that we are constantly monitoring and evaluating the effects of climate on our everyday operations. An important aspect of getting these measures in place across the business is the behavioural change needed in staff. The entire organisation needs to buy in to the concept of climate change adaptation in order to ensure resilience to the impacts.

### **7.2. Reliability of data**

Sound data is needed to ensure that we are following the correct programme of measures in our climate change adaptation strategy. If the data used to determine our strategy is unreliable we will not be able to make informed decisions. This will lead to incorrect and unsuitable actions being taken or no action being taken when action is needed.

### **7.3. Regulatory constraints**

All water companies are subject to a high degree of regulatory scrutiny. When making any investment decisions, we have to prove that our actions are justified and cost beneficial. We also need to use our resources in the most efficient manner. Therefore we need to be certain that when an investment decision is made it is based on the best evidence possible. Due to the uncertainty around the predicted future conditions and lack of data in certain areas, it becomes difficult in certain cases to justify actions that may be needed to address future climate change.

We need to maintain good communications with our various regulators and ensure that they are communicating with one another. As a result of our various regulators having their own specific areas of interest there is a possibility that in future an output from one regulator may contradict that required by another.

## 7.4. Carbon Impact

Many adaptation measures that will be required in future may be hard engineering solutions. These may have a significant carbon footprint and thereby accelerate climate change

## 8. Reporting and Review

- The Climate Change Adaptation Plan (CCA) is an iterative document we have incorporated climate change adaptation into our corporate reporting structures, this will ensure that any climate change related issues are identified and the subsequent adaptation actions are closely monitored.

**Table 8.1 Monitoring outcome, implementation and residual risks**

| Action   | Responsibility | Mechanism                             | Frequency     |
|--|----------------|---------------------------------------|---------------|
| Monitoring the outcomes of the adaptation programme                                  | Executive      | Climate change adaptation plan review | Yearly        |
| Monitoring and incorporation of climate change threshold into future risk assessment | Regulation     | 5 year Regulatory Business Plan       | Every 5 years |
| Monitoring the residual risks on stakeholders and the organisation                   | Regulation     | 5 year Regulatory Business Plan       | Every 5 years |

**Table 8.2 Company processes to monitor the implementation of adaptation**

| Level     | Process                                       | Frequency     | Comments   |
|-----------|---|---------------|--|
| Strategic | Formal review of risk register and actions    | 2 per year    | Formal process of review   |
| Strategic | Review of key standards and policy objectives | As necessary  | Based on political, regulatory and customer views                    |
| Company   | Business plan                                 | Every 5 years | Climate impacts to be taken into account for all business activities |
| Company   | Water Resource Plan                           | Annual        | Already takes climate change into account                            |
| Company   | Review of Water Safety Plan                   | Annual        | Climate change impacts to be included                                |

## 9. Recognising opportunities

- We recognise that not all the impacts of climate change are negative; we will continue to review and update our risks when new evidence comes to light.
- *Drought:* We have not identified any opportunities as a result of drought at present
- *Temperature:* Increased temperatures could have a positive effect on water treatment making the process more efficient.
- *Flood:* We have not identified any opportunities that will arise as a result of flooding at present
- *Sea level Rise:* We have not identified any opportunities that will arise as a result of sea level rise at present

## 10. Further information for the assessment of this plan

This section links the 8 criteria that Cranfield Risk will be assessing with the relevant parts of the climate change adaptation report.

## Cranfield key attributes of CCA reporting

| Key attributes of RA   | Assessed in  | Comments   |
|--|--|--|
| Climate change risk assessment is a clear component of corporate risk appraisal  | Part 4.2 Implementing adaptation into business practice                      | We have included climate change risk to the company risk register to be reviewed as part of the corporate risk management process. Climate change is already taken into account in Water Resources Management Plans and company asset management plans |
| Climate change risk assessment allows Reporting authority to make evidence based decisions on adapting to climate change | Part 3 summary of risks  | Qualitative risk assessment was undertaken to highlight areas that need to be assessed in more detail during the next round of regulatory planning.  |
| Demonstrate use of relevant appropriate data, information, knowledge and tools   | Part 1.7<br>Part 2 Approach<br>Part 3 Summary of risks<br>Appendices 1 and 2 | Expert judgement was used in conjunction with the UKCIP 09 climate change scenarios  |
| Climate change risk assessment and adaptation measures explicitly consider uncertainties                                 | Part 5 uncertainties and assumptions   | Asset management (AMP) plans and Water Resource Plans (WRMP) have to take uncertainty into account   |
| Climate change risk assessment generates priorities for action   | Part 3 Summary of risks<br>Part 3.3.7  | The qualitative risk assessment has highlighted areas that could possibly pose threats in the future. These will be taken into account in the next round of regulatory planning  |
| Climate change risk assessment identifies opportunities  | Part 3.4 Opportunities as a result of climate change                         | Climate change related risks are part of a number of risks faced by the company. We have not identified any opportunities in this iteration of the CCA report. This will be held under review  |
| Clear demonstration of flexible adaptation measures  | Part 2 Approach<br>Part 7.5  | Water companies are encouraged to be flexible through long term regulatory planning.   |
| Monitoring and evaluation of adaptation effectiveness  | Part 7 Monitoring the outcome of the adaptation programme                    | Climatic impacts are already taken into account in most areas of operation however this report provides an opportunity to formalise the assessment of climate change risk is embedded in our day to day operations                                     |

# **1. Company functions impacted by climate change**

## **1.1. Introduction**

We are required to assess the climate change risks facing the operation of our business. As we are a provider of an essential service on which the public depends, we have a duty to ensure we will be able to supply clean safe drinking water under uncertain future climatic conditions. The supply of safe reliable drinking water is the core function of our business. Furthermore we need to ensure that we manage demand and maintain asset robustness and resilience. We also need to conduct our business in a sustainable manner, strive to reduce costs while maintaining good corporate governance, price stability, consistency and continuity.

## **1.2. Company overview**

Bournemouth and West Hampshire Water (BWH) provide clean drinking water to about half a million people in an area from the outskirts of Poole to Southampton Water and from Bournemouth to just South of Salisbury. We supply approximately 184,000 households and 16,000 other properties, using a network of 2787km of water mains. We obtain up to 85% of our water from run of river abstractions on the Hampshire Avon and the Dorset Stour, and the remainder from boreholes. We do not treat wastewater; in our area the sewerage services are provided by Wessex Water and Southern Water. We have a long and successful tradition of supplying water. Our predecessors Bournemouth and District Water and West Hampshire Water were established by Acts of Parliament in 1863 and 1893 respectively, and were merged in 1994.

Our company strategy is to maintain our excellent record and to continue to improve our performance in response to customers' requirements. Compared with most water companies, we are a small and local business. This has advantages in terms of responsiveness, but it also increases operational risk and our vulnerability to extreme climatic events. Our aim is to continue to be amongst the leading performers in the UK water industry by all measures, including sustainability, leakage, water quality, efficiency and customer service. We strive to position ourselves as a flagship organisation in order that our global shareholders can use us as a reference point for quality of service. By taking this approach we will benefit our stakeholders both now and in the future.

### 1.3. Company functions, mission aims and objectives

The main function of our business is to supply safe, reliable, high quality water to our customers. To ensure that we can continue to do this we need to take all risks to service into account and ensure we have controls in place to deal with these risks. This report serves to identify the effects of climate change impacts on our business and serves as a means of mainstreaming climate change into everyday business activities. Below we have listed our key concerns.

- Reliability of the water supply

It is fundamental that we provide a reliable, value-for money water supply to all our customers, meeting all the obligations placed on us in providing an essential public service. In order to ensure that we maintain a reliable service we need to make sure that our business has the ability to adapt to future climatic impacts.

- Drinking water quality

Closely related to reliability, the water we supply must meet all the legal and regulatory standards of quality and safety.

- Demand management

An important focus for us is the application of a number of tools and techniques to manage demand, including the promotion of customer metering and water efficiency, and leakage control. By doing so we can postpone or avoid the need for new water resource development, which we acknowledge will be difficult in this locality because of the sensitivity of the water environment. For future planning we need to take into account the effects that the changing climate will have on the demand patterns of our customers.

- Asset robustness and resilience

In the face of climate change and similar uncertainties, we must ensure that all our assets are designed, operated and maintained in such a way to secure and protect the reliability and quality of the water supply. This may increase activity and expenditure in renewing and replacing water mains.

- Sustainability

By operating in a sustainable way today we will ensure those future generations will also be able to operate without compromising the quality of the service.

- Cost reduction

We have succeeded in reducing our costs of operation in recent years, and we will continue to strive to make efficiencies in future. This is likely to become more difficult in the face of rising cost pressures and increasing climatic variability.

- Corporate governance

It is essential that we operate to, and can demonstrate that we operate to, high standards of integrity, compliance and corporate governance. This principle applies to everything we do.

- Price stability

Our customers have told us that, with regard to pricing, they prefer stability to volatility. We will endeavour to achieve stability subject to the constraints of the price-setting mechanism, and any unforeseen new obligations.

- Consistency and continuity

We need to be consistent in delivering a good reliable service to our customers. They expect us to carry on undertaking our obligations in the same manner going into the future irrespective of the impacts of climatic variability.

The climate change adaptation plan is a means to ensure climate change is considered as a factor in all business planning and activities. It will serve to increase the resilience of the company and is a way of ensuring we protect our customers both now and in the future. We see this plan as a live document, which will be continually updated to ensure that we are completely up-to-date with the latest information that is relevant to climate change risk management.

---

## 1.4. Areas of operation and functions affected by climate change

This section describes the manner in which our company operates and the climatic conditions that are predicted for our region and give a summary of the main impacts that these different climatic conditions have on the company.

Weather and climate affect economic activity and everyday lives in many ways. As the climate continues to change, the impacts will affect almost every aspect of our business and will result in unexpected costs as well as changes to the operating environment. If we plan ahead we can minimise the threats and take advantage of the opportunities created by the current and future climate. Our climate change adaptation strategy takes a high-level, strategic and holistic view of the risks and opportunities to our organisation. This is an iterative document, which will constantly evolve as our knowledge of future climatic impacts related to climate change improves.

### 1.4.1. Key climate change impacts

For the purpose of this report we have used the Water UK methodology<sup>4</sup>. Following this we have divided the predicted climate change scenarios into four headline climate change risk groups.

1. Drought

This includes the affects of lower rainfall levels, lower ground water levels, and reduced soil moisture and infiltration levels.

2. Temperature rise

Higher peak and average temperature, higher levels of evaporation.

3. Flooding

Increased intensity of summer rainfall, increased winter rainfall, greater rainfall intensity, higher groundwater levels and increased soil moisture.

4. Sea level rise and storm surges.

More information on climatic predictions for South West England can be found in Appendix 1.

---

<sup>4</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

### **1.4.2. Impacts of climate change on the company**

Each of the headline climate change risk groups described in 1.4.1 are made up of a number of climate change impacts which in turn give rise to consequences and hazards that could be faced by the company as a result of:

- fluctuations in the availability of resources
- impacts on infrastructure and processes

The headline consequences and hazards include:

- loss of supply
- failure of assets
- increased demand
- business consequences such as the risk to company shareholders and access to finance
- Socio-economic consequences including effects that will arise as a result of changing behaviours, working patterns, social norms, population dynamics and economic activities
- Supply chain, possible risks to suppliers that have a bearing on the company carrying out its functions

These are described in more detail in section 3 of this report.

---

## 1.5. Areas of operation affected climate change impacts

The functions of the business encompass a number of interlinked areas of operation across all our business activities. For the purpose of the adaptation report we have grouped the functions into four areas of operation within the business, these being:

1.5.1. Water resources

1.5.2. Water quality

1.5.3 Infrastructure

1.5.4. Corporate functions

These areas operate together to allow the business to carry out its activities and meet its objectives and encompass all we do. All these areas need to have the potential to adapt or be adapted to cope with the environmental and social pressures that will arise as a result of future climate change.

Responses to these impacts include adaptation, investment and changes of behaviour. Below we provide a summary of the areas of operation we have listed and described the key impacts on these areas. We have based our assessment on the climate change risks identified in the Water UK methodology<sup>5</sup>.

### 1.5.1. Water resources

Water resources involve the sustainable management of our run of river and groundwater abstractions and include:

- Forecasting demand and yields to ensure that supply meets demand
- Ensuring that our abstractions do not have a disproportionate impact on the environment.

Changes in weather patterns, temperature and socio economic factors will have a marked effect on this area of our business.

It can be seen from predictions that the overall increased precipitation in the winter will balance out the decreased summer precipitation. Meaning that annual average rainfall will remain similar to what we currently experience. It is however, important to note that the changes we are likely to see will occur at the extreme ends of the flow distribution profile. Summer flows are likely to be lower than we are used to seeing and as a result of more extreme winter rainfall events we are likely to see an increase in higher flow percentiles.

---

<sup>5</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

*Decreased summer rainfall*

This will lead to reduced runoff and therefore a resulting reduction in river flows. As we have limited surface storage and 85 % of our abstractions rely on the instantaneous performance of our run of river sources, extreme low flows could reduce our ability to abstract water in a sustainable manner.

*Temperature increases*

Increases in temperature have a direct effect on demand; periods of prolonged hot weather will have an impact on peak demands.

*Socio-economic consequences*

These present the greatest uncertainty with regards to water resources. It is our experience that increased demand correlates to increases in temperature. With predicted warmer summer temperatures there is a possibility that we would experience an increase in demand.

Our supply system already experiences high peak demands during the summer months with a peak to average ratio that is one of the highest in the country. This is mostly due to discretionary use such as garden watering and the fact that our residential profile is dominated by the most affluent socio-economic groups with a high incidence of detached houses and large gardens. In our 2007 drought plan we estimated that the number of overnight visitors to Bournemouth during the peak months of July and August was over 50 000 people. This excludes day visitors and is approximately 12% over our usual residential population. With higher summer temperatures we could see even greater numbers of people visiting our area.

A major part of our area of supply includes the South East Dorset conurbation, which is the second largest urban area in South West England. It is also one of the fastest growing, experiencing a large amount of in migration. The population of the area is characterised by a high proportion of elderly people and forecasts point towards the number of elderly residents increasing in future. The area is also characterised by an increasing number of smaller and single occupancy households<sup>6</sup>. This has implications for household per capita consumption moving into the future.

---

<sup>6</sup> The Draft Regional Spatial Strategy for the South West 2006-2026:  
June 2006 the South West Regional Assembly

### 1.5.2. Water quality

Water quality is concerned with all matters related to the application and interpretation of the water quality regulations. The following activities form part of the water quality function:

- water quality sampling at all phases of the water distribution cycle
- monitoring and forecasting from collected data
- reacting to any failure in water quality standards including short term mitigation and trending for long term issues
- dealing with customer complaints, queries and concerns
- implementing the requirements of the water fittings regulations and notifications approval as well as on site inspections of plumbing

#### *Higher temperatures and lower summer rainfall*

This will result in increased evaporation and a shortened recharge period. The drier summers will also affect the amount of runoff entering our rivers. Increased solar radiation and decreased cloud cover could also lead to enhanced macrophyte growth and algal blooms. Long periods of low flow could also have an affect on the amount of dissolved oxygen in river water with implications for river biota.

#### *High intensity rainfall events*

These could lead to high pulsed loads of nitrogen, phosphates micro-organisms and pesticides during the autumn. We also experience turbidity problems caused by suspended mineral solids after periods of intense rainfall.

#### *Socio economic consequences*

This will have an affect on this area as land use practices may change would also lead to new challenges to existing treatment processes.

### 1.5.3. Infrastructure

#### **Below ground infrastructure**

Below ground infrastructure includes the entire network of mains used to transport water through the entire production cycle

The functions of this area include:

- The distribution of wholesome water
- Continuous reliable water supply through a network of water mains and infrastructure
- Maintenance of network of underground mains of varying ages, some up to 100 years in age from 12.5mm to 900 mm constructed from a variety of different materials due to their age and different responses to temperature and ground conditions
- Supply of around 151 mega litres (151,000,000 litres) per day
- Effective utilisation of the network to maintain levels of service
- To ensure leakage remains at an acceptable level
- Utilise resources in an effective manner through optimal network management

#### *Higher temperatures and lower precipitation*

This will increase pressures on our system through increased demands having an impact our ability to meet levels of service. Below ground assets are most vulnerable from ground movement as a result of changes in temperature and soil moisture. Ways of mitigating these effects such as increasing trench depth may need to be considered in future.

#### *Drought*

During times of drought the increase in fires could stress the network from fire service demand.

#### *Flooding*

The most common impacts will be third party effects (sewers and storm runoff). There is also a possibility that we could face transport issues due to flooding of access routes.

## **Above ground infrastructure**

Above ground infrastructure includes all treatment works, pumping stations, reservoirs and other management assets such as offices, IT equipment and vehicles.

The function of above ground infrastructure includes:

- To enable the company to abstract and treat our licensed amounts of abstracted water to a wholesome quality.
- Supply water, through a system 6 treatment works, 19 source and intake and distribution pumping stations pumping stations, 23 service reservoirs and 4 water towers.
- Maintain assets through a strategy of proactive and reactive management, allowing the supply of water to be continuous and resilient.

### *Flooding*

Flooding is taken into account in the design of all key above ground assets. Currently these are designed to be resilient to floods of up to a 1 in 200 year magnitude. There are schemes in place in the AMP 5 period set to improve flood resilience to what is currently considered to be 1 in 1000 years for those assets identified as being vulnerable to flooding. When the knowledge of future flooding scenarios becomes more accurate it is possible that this may need to be reassessed and new design standards or flood mitigation measures implemented. There are also possible site access implications. In future a review of the suitability of vehicles may be necessary.

### *Temperature increases*

Our above ground infrastructure is designed for the current climatic conditions. Although design specifications allow for deviation from average these extremes usually only occur for short periods of time. In future it is possible that the capability of our current assets could be put under stress through longer duration extreme weather. Future planning needs to take into account the possibility of increased construction costs to allow assets to cope with new temperature ranges.

As a company we keep a risk register for all assets. Flooding constitutes one of many potential risks that could cause interruptions to supply. Risks are quantified in the register for each case giving the severity and likelihood of occurrence as well as giving the means by which each failure mode can be managed, mitigated or overcome. In general terms because of the numerous causes of asset failure we manage our system with adequate flexibility to cope with this and reduce the effects on customers.

#### **1.5.4. Corporate functions**

The corporate function is divided into two parts, namely corporate services and revenue services. Our corporate services include IT, HR, Quality, Environment, Health and Safety, Finance and Risk Management. Revenue Services includes all services associated with customer billing and payment processing. The corporate function of the business largely deals with the company staff and interactions with customers.

##### *Socio-economic*

The socio-economic consequences resulting from the various climate change risks will have the greatest implications for the corporate function. These include changes in population dynamics such as a large inwards migration of older retired people. This could have implications for managing our network arising from changes in diurnal use patterns.

##### *Changing climatic conditions*

Changes in conditions will lead to changes in work patterns and customer behaviour. Changing demographics with a larger number of smaller single occupancy households in our area as pointed out in the South West Regional Strategy will have implications for demand planning.

Although the Corporate function will be affected by climatic events it is important to note that these impacts are going to happen over a long period of time. People and working practices will have time to adapt to these changes as they are not going to occur overnight.

## 1.6. Summary of climate change impacts and their consequences on water company areas of operation

This section provides a summary of the consequences identified in the Water UK<sup>7</sup> study that have the potential to affect the areas of operation listed in section 1.5. These impacts are generalised for all water companies and not specific to one single company.

### Area of operation - water resources

| <i>Risk group</i>  | <i>Consequences</i>   |
|--------------------|---|
| <b>Drought</b>     | Reduced available supply<br>Changes in daily peak demands<br>Low river levels<br>Lower groundwater levels<br>Lower yields from sources<br>Pressure on surface storage<br>Reduction in security of supply<br>Reduced groundwater levels affecting borehole performance |
| <i>Risk group</i>  | <i>Consequences</i>   |
| <b>Temperature</b> | Changes in demand and customer behaviour  |
| <i>Risk group</i>  | <i>Consequences</i>   |
| <b>Flood</b>       | High intensity rainfall events compact upper layers of soil layers causing increased runoff reducing groundwater recharge   |

<sup>7</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

## Area of operation - water quality

| <i>Risk group</i>  | <i>Consequences</i>   |
|--------------------|---|
| <b>Drought</b>     | <p>Low flows leading to sedimentation and blockages of pipes</p> <p>Reduced raw water volumes reducing dilution</p> <p>More frequent inversions leading to greater cryptosporidium accumulation</p> <p>Lower flow rates leading to deposition and reduced raw water quality</p> <p>Low flows leading to sedimentation and blockages</p> <p>Intermittent supply causing silts and debris being flushed from storage towers into the system</p> |
| <i>Risk group</i>  | <i>Consequences</i>   |
| <b>Temperature</b> | Increased algal growth and other biological issues  |
| <i>Risk group</i>  | <i>Consequences</i>   |
| <b>Flood</b>       | <p>Increased runoff leading to higher sediment loads</p> <p>Contaminants entering the supply system through infiltration</p>  |
| <i>Impact</i>      | <i>Consequences</i>   |
| <b>Sea level</b>   | None from present information-we will continue to monitor the effects   |

## Area of operation – infrastructure

| <i>Impact</i>      | <i>Consequences</i>  |
|--------------------|--|
| <b>Drought</b>     | Pipe failure due to de-pressurisation<br><br>Low river/groundwater below intake/pump levels  |
| <i>Impact</i>      | <i>Consequences</i>  |
| <b>Temperature</b> | Higher average and peak temperatures affect structures and buildings, possible reductions in asset life and operational ability of assets<br>Ground movement leading to increases in mains failures  |
| <i>Impact</i>      | <i>Consequences</i>  |
| <b>Flood</b>       | Loss of assets and service failure through direct flooding<br><br>Storm events leading to loss of power supply<br><br>Increased storm water leading to increased pump usage and accelerated deterioration<br>Higher flows could pose risks to pipe bridges |
| <i>Impact</i>      | <i>Consequences</i>  |
| <b>Sea level</b>   | Inundation   |

## Area of operation – corporate services

| <i>Impact</i>      | <i>Consequences</i>   |
|--------------------|---|
| <b>Drought</b>     | Financial impact of dealing with drought                              |
| <i>Impact</i>      | <i>Consequences</i>   |
| <b>Temperature</b> | Working in extreme temperatures                                       |
| <i>Impact</i>      | <i>Consequences</i>   |
| <b>Flood</b>       | Access to sites   |
| <i>Impact</i>      | <i>Consequences</i>   |
| <b>Sea level</b>   | None from present information-we will continue to monitor the effects |

## 1.7. Thresholds above which climate change climate change and weather events will pose a threat to the business

All extreme weather poses a threat to our business in some way. We have always experienced extreme weather in the past and continue to do so in the future with certain types of extreme weather becoming more prevalent as a result of climate change. This section provides an estimation of future climatic conditions and compares them with conditions experienced in the past.

### 1.7.1. Predicted climate change impacts based on the UKCIP09 medium emissions scenarios<sup>8</sup>

We have used the UKCIP scenarios to evaluate potential future climatic conditions for our region. We obtained long term rainfall and temperature data from the Met Office for Hurn station.<sup>9</sup>

In the charts below we have compared:

- summer mean daily maximum temperatures
- annual mean precipitation
- winter mean precipitation
- summer mean precipitation

To get an indication of what future climatic conditions could be, we have added or subtracted the percentage change provided in the UKCIP 09 predictions from the baseline values provided for each of the parameters mentioned above.

In all cases we have plotted the *historic average data (1957-2009)* as a baseline. We have then plotted the *high, medium* and *low* estimates for each parameter based on the predicted change values provided in the UKCIP 09 medium emissions scenarios for the time periods 2020, 2050 and 2080.

The *high* and *low range* values have been estimated from the highest and lowest values of the most likely range of conditions provided in UKCIP 09 medium emissions scenarios. This gives us an indication of the range of possible future conditions.

We also plot the highest and lowest recorded historical values for each of the parameters. This provides a means of comparing the future conditions with the extremes of conditions that have been experienced in the past.

---

<sup>8</sup> <http://ukclimateprojections.defra.gov.uk/content/view/2271/528>

<sup>9</sup> <http://www.metoffice.gov.uk/climate/uk/stationdata/hurndata.txt>

1.7.2. Summer mean daily maximum temperature

The predictions for summer mean daily maximum temperature show that we will experience temperatures that are significantly higher than the average. However both our highest average daily temperature for a single month and highest recorded summer mean daily temperature recorded in 1995 fall within the expected range of future predictions showing that we have managed to deal with these conditions in the past. The average summer mean daily temperature falls outside of the range of predicted values indicating that we do not experience these conditions on a regular basis. In future we need to plan for more frequent periods of high summer temperature and the impacts associated with these conditions.

### 1.7.3. Annual mean precipitation

Annual mean precipitation does not show a significant deviation from what we currently experience. From the above figure we note that the range of mean annual precipitation experienced in the past is far wider than that predicted in the UKCIP 09 scenarios. Predicted mean annual precipitation will not have a marked impact on the company and the carrying out of our functions. However we do note that the nature and intensity of the rainfall events will change. This is something that will be monitored, as high intensity rainfall events could pose potential impacts with regard to surface flooding.

1.7.4. Winter mean precipitation

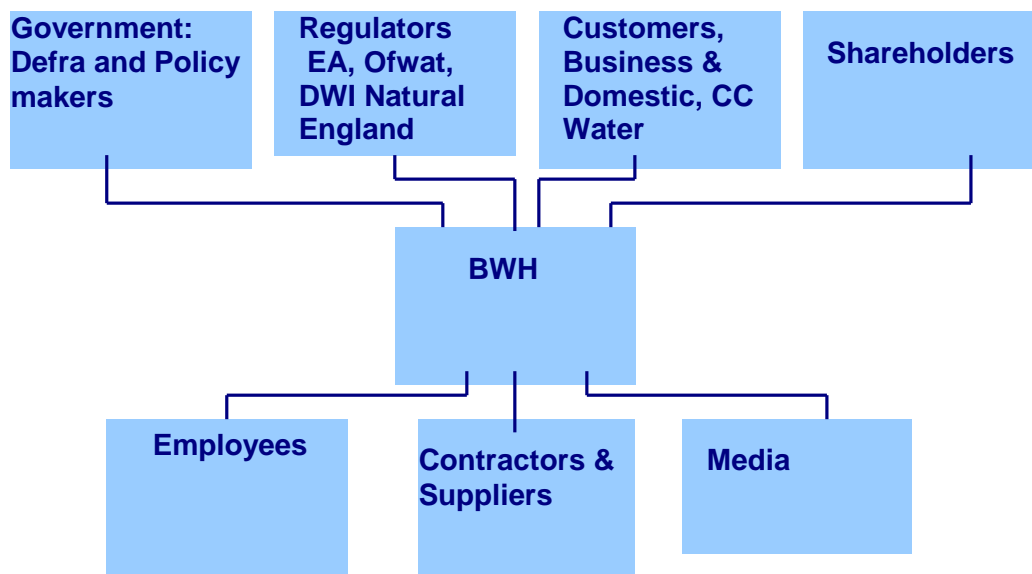

Winter mean precipitation is predicted to be higher than our current mean winter precipitation. The increase in winter precipitation provides a benefit to the company in that it allows for greater groundwater recharge. Our highest recorded mean winter rainfall is significantly higher than the highest estimated future value indicating that we have capacity to deal with the predicted conditions at present. We will continue to monitor the impacts of increased winter precipitation on areas of operation with particular emphasis on the impacts on surface flooding.

### 1.7.5. Summer mean precipitation

Summer mean precipitation is predicted to be lower than current average summer precipitation. Our lowest recorded mean summer rainfall occurred in 1995 and is significantly lower than the lowest predicted future summer rainfall scenario. Mean summer rainfall is a factor in all water resource and business planning and therefore the effects are monitored and updated as part of regular business planning.

## 1.8. Key stakeholders

*Defra* is the UK government department responsible for policy and regulations on the environment, food and rural affairs. Defra's Structural Reform Plan (SRP) lays down three departmental priorities, one of which is to "support a strong and sustainable green economy, resilient to climate change". Defra is responsible for publishing the statutory guidance to reporting authorities<sup>10</sup>

*Ofwat* is the water industry economic regulator responsible for setting an upper limit on the price that each regulated water and sewerage company can charge its customers. Ofwat protects the interests of water company customers by incentivising efficiency and high service standards and penalising inefficiency and poor service. Price limits are set through the price review (PR) process. The price review is a financial review process whereby Ofwat determines the price limits that water companies can increase or decrease the prices charged to customers over the next 5 year period.

Each water company submits a Business Plan (BP) for the period of the review which is assessed by Ofwat. These price limits are set to enable water companies to deliver the services required of them over a five year period. These include allowing for capital maintenance of assets, ensuring security of supply and meeting drinking water and environmental quality standards and requirements. The price limits for 2010 to 2015 were set in 2009.

*The Environment Agency* is a non-departmental arm of DEFRA put in place to protect or enhance the environment and promote the objective of achieving sustainable development. Their remit covers the whole of England and Wales. The Environment Agency monitors all raw water abstractions and company environmental performance.

<sup>10</sup> Defra, "Adapting to Climate Change: helping key sectors to adapt to climate change", 2009

The *Drinking Water Inspectorate DWI* ensures that the water companies in England and Wales supply safe drinking water that is acceptable to consumers and meets the standards set down in law.

*Natural England* ensures sustainable stewardship of the land and sea. They work with farmers and land managers; business and industry; planners and developers; national, regional and local government; interest groups and local communities to help them improve their local environment. Natural England oversees the management of sites designated for nature conservation and ensures the company meets its obligation to conserve and improve biodiversity.

We have various other key stakeholders, including local authorities, contractors, suppliers, local community groups, business and domestic customers.

The direct impacts of climate change on our key stakeholders are mostly out of our control. Certain suppliers such as those providing energy are essential public services and therefore should have adaptation plans in place themselves. We informed all our stakeholders about the company's plans and objectives for the next 25 years in our Strategic Direction Statement.

# Climate Change Adaptation Plan

## Part 2

### Company approach

  - 2.4. Evaluation of the costs and benefits of the proposed adaptation options**

## 2. Approach climate change adaptation

### 2.1. Introduction

Our methodology for evaluating the impacts of climate change on our business broadly follows that prescribed in the decision making matrix found in the UKCIP technical report (figure 2.1) This framework will be applied in some form for all assessment of climate change risk across the company.

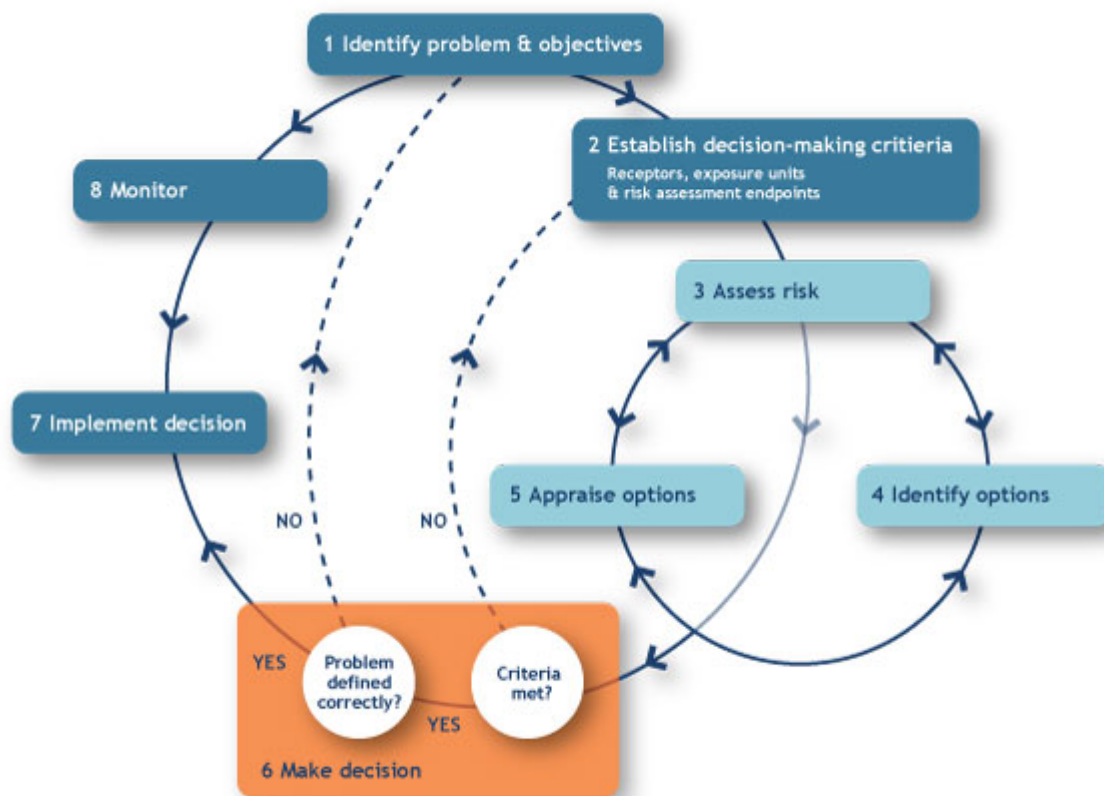

Figure 2.1: Decision making framework<sup>11</sup>

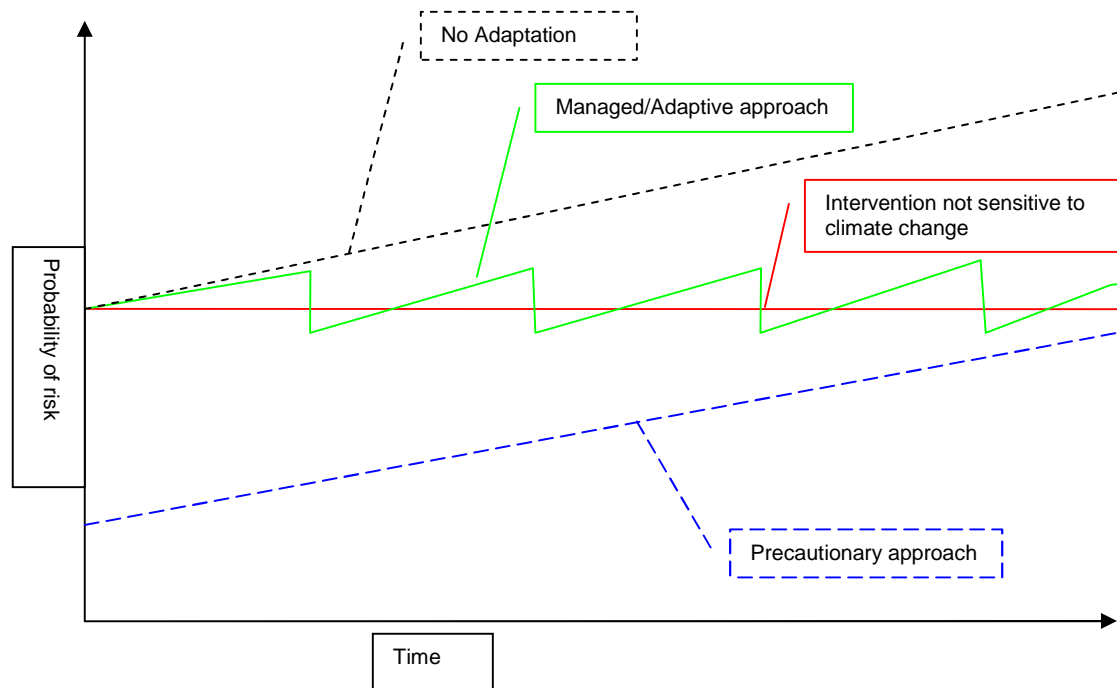

#### 2.1.1. Company approach to managing risk and climate change adaptation

The Climate Change Adaptation report is structured so that any changes in assumptions and plans can be added in the future. The company adaptation plan will be monitored and updated on an annual basis. Climate change is already taken into account in our long term planning for water resources and asset management. This plan will ensure that climate change becomes embedded in all future decision making. It will also ensure that the same set of criteria is used when assessing future climate change impacts on any one area of operation. Responding to the impacts of climate change requires us to adopt one of two approaches to risk: namely the Precautionary approach or

<sup>11</sup> Climate adaptation: Risk, uncertainty and decision-making UKCIP Technical Report  
Climate Change Adaptation Plan

the Managed adaptive approach: (see chart 2.1.1) Climate change risks are just one of many faced by the company. As with all risks we have controls in place to deal with these risks. Through the process of our business planning all risks to carrying out our operations are considered. In the event that we identify a new threat to the company this and the associated controls are included on the company risk register or Water Safety Plan.

**Chart 2.1.1 Risk management approaches** <sup>12</sup>

### 2.1.2. The Precautionary approach

The precautionary approach is adopted when future adaptation may be technically unfeasible or too complex to administer over the long term. This approach is taken when planning for long life assets such as underground infrastructure. These assets are going to be in the ground up to and over 100 years and therefore multiple interventions to manage future risk are not feasible.

### 2.1.3. The Managed adaptive approach

The managed adaptive approach tracks the risk over time and allows for risk to be managed through multiple interventions over time. Large capital schemes require good data and need a high level of confidence that the solution will be successful and efficient use of money. By following a managed adaptive approach we can approach investment in smaller incremental steps thereby reducing the risk of using resources in an inefficient manner. All water companies are expected to manage both above and below ground assets through the five year Asset Management Plan (AMP) periods. This gives us a window of opportunity every five years to assess climate risks as these and

<sup>12</sup>Flood and Coastal Defence Appraisal Guidance FCDPAG3 Economic Appraisal  
Supplementary Note to Operating Authorities – Climate Change Impacts October 2006  
Climate Change Adaptation Plan

their consequences become better known. This will provide an ideal opportunity to adapt our systems, procedures and infrastructure to be resilient to future change.

## **2.2. Evidence methods and expertise used to evaluate climate change impacts**

For the purpose of this report we have limited our analysis to a high level. Climate change risks and hazards have been assessed and identified by following the Water UK study, A Climate Change Adaptation Approach for Asset Management (2007)<sup>13</sup>. These impacts have been analysed with reference to the UKCIP09 scenarios by relevant experts across all areas of the business. References to the material used in compiling the list of impacts are provided in Appendix 4.

### **2.2.1. Evidence**

To determine the future climatic conditions we have used the UKCIP scenarios described in section Appendix 1 of this report. The Water UK study<sup>14</sup> provides water companies with a list of environmental risks and associated consequences that will arise as a result of changing climatic conditions.

### **2.2.2. Methods and expertise**

Where possible we have followed the UKCIP decision making framework when evaluating the impacts of climate change on our business. Our qualitative risk assessment has been carried out by relevant experts across the company. This was done by evaluating the impacts identified in the Water UK study in terms of the UKCIP 09 climate projections. The highest scoring impacts on the companies various assets and the associated hazards were then cross referenced to company publications listed in table 2.2.2. This was done to ensure that the hazards identified in the risk assessment have been taken into account. These hazards and consequences are either dealt with in regulatory planning such as the Water Resource Management Plan, Drought Plan and Asset Management Plan or in strategic documents such as the company risk register and Water Safety Plans.

<sup>15</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning  
41414874 V1.0

## **2.3. Quantifying and assessment of risk**

This report covers potential impacts for the time periods 2020's 2050's and 2080's with the greatest emphasis and certainty around those impacts identified for the 2020's. This ensures that we are consistent with our Water Resources Management Plan and Company Strategic Direction Statement which is the company strategy for the next 25 years.

The Water UK study provides a common approach for assessing climate change adaptation risks and allows these to be incorporated into asset management planning. For water only companies such as Bournemouth & West Hampshire Water the study identifies how droughts, temperature rise, flooding and sea level rise affect the company assets

As it has been pointed out the company aims to maintain or improve our levels of service. Our risk assessment takes into account the consequences for service in combination with the likelihood of that consequence occurring in the future. We apply this to all the impacts identified in the Water UK study which encompass all areas of operation across the company.

### **2.3.1. Levels of Consequence**

We have based our risk assessment on the corporate risk assessment structure used in all areas across the business. Relevant experts across the company used the matrix found in table 2.3.1 to score all the climate change impacts that were highlighted in the Water UK study.

**Table 2.3.1 Likelihood score**

| HARM ASSETS/SERVICES   | REPUTATION  | INTERNAL  | DAMAGE                                      | LOSS   | SCORE    |
|--|---|---|---|--|----------|
| Minor damage, extra repairs or maintenance   | -No impact on reputation                                | -Short run loss of a business system  | -Minor<br>-Few customer complaints          | -Minor<br>-£10K to £40K<br>-Loss of supply to <1K customers                                | <b>1</b> |
| Minor deterioration in assets  | -Minor local press release (one local paper)            | -Short run loss of supply   |   | -Loss of supply to 1K to 2K customers  | <b>2</b> |
| Deterioration of assets requiring substantial maintenance/replacement, change to investment plan | -Broad local press coverage (Most local papers & radio) | -Long run Loss of IT\Comms<br>- Fire in principle building<br>Major overheads for staff | -Major<br>-Multiple customer complaints     | -Major<br>-£40K to £100K<br>-Loss of supply to 2K to 5K customers                          | <b>3</b> |
| Major maintenance/replacement of assets, reduction of Security of supply                         | -National press coverage<br>-Local TV coverage          | -Unable to control business system<br>-Long run loss of business system                 |   | -Loss of supply to 5K to 10K customers<br>-National press coverage                         | <b>4</b> |
| Failure of service/asset   | -Long term loss of reputation                           | -Unable to control water supply<br>-Long run loss of water supply                       | -Catastrophic<br>- Undefendable prosecution | -Catastrophic<br>-£100K +<br>-Loss of supply to 10K+ customers<br>-Loss of BWHW reputation | <b>5</b> |

### 2.3.2. Likelihood score

The likelihood of the company being affected by the various climate change impacts identified in the Water UK study are determined by assessing the most likely future climate scenarios and using expert judgement to determine the probability of the predicted conditions affecting the various areas of operation for each time period.

**Table 2.3.2**

| Likelihood         | Description  | Score |
|--------------------|--|-------|
| Extremely unlikely | Almost no chance of occurring during the timeframe | 1     |
| Unlikely           | Low probability will occur during the timeframe    | 2     |
| Possible           | Medium probability will occur in the timeframe     | 3     |
| Likely             | High probability will occur in the timeframe       | 4     |
| Almost certain     | Almost certain to occur in the timeframe           | 5     |

### 2.3.3. Risk Score

Impacts are scored and classified using table 2.3.3 below. Risk score = Level of consequence x Likelihood. The highest scoring risks are analysed in further detail in part 3 of this plan.

**Table 2.3.3 Risk Scores**

| Risk        | Score |
|-------------|-------|
| High Risk   | 15-25 |
| Medium Risk | 8-14  |
| Low Risk    | 1-7   |

### 2.3.4. Confidence in assessment

The level of confidence in our assessment of risk reflects the type of analysis undertaken and the confidence in the predicted future climate conditions.

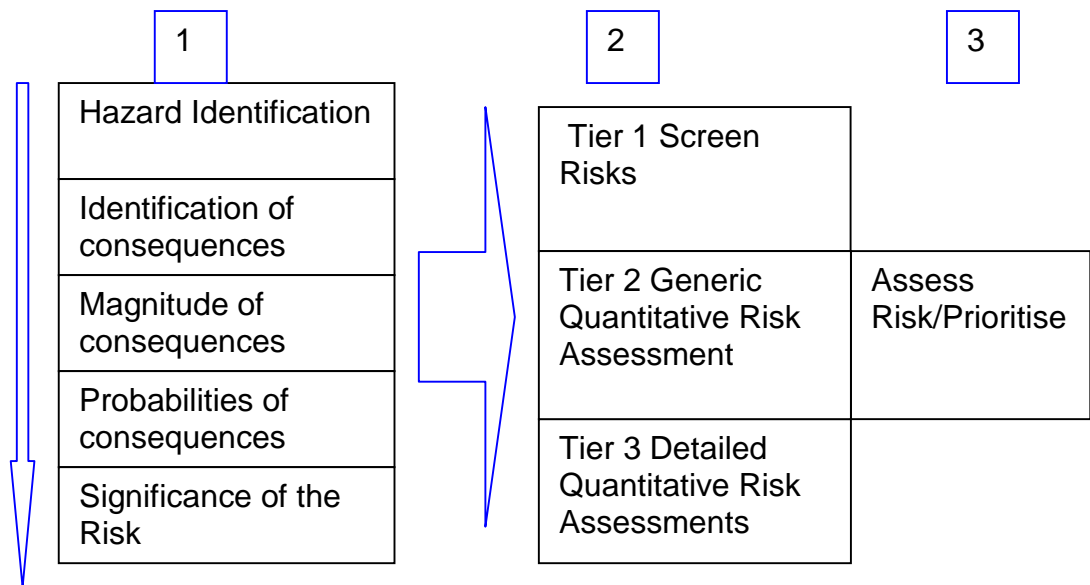

**Table 2.3.4 Confidence**

| Confidence in assessment | Analysis                  | Attributes  |
|--------------------------|---------------------------|---|
| High                     | Quantitative              | Experienced similar conditions in the past. High degree of certainty in predicted future conditions             |
| Medium                   | Expert qualitative        | Experienced similar conditions in the past. Medium level of certainty in predicted future conditions            |
| Low                      | Best estimate qualitative | Conditions fall outside of those experienced in the past. Low level of certainty in predicted future conditions |

2.3.5. Risk assessment methodology

In compiling the risk assessment for the climate change adaptation plan we followed the methodology in the Climate adaptation: Risk, uncertainty and decision-making UKCIP Technical Report.

3 tier risk assessment<sup>16</sup>

The three tier process <sup>17</sup>

**Tier 1** – a systematic qualitative analysis, where the size, significance and relative importance of the risks, costs and benefits for each option are described. This has been done using the company 5 x 5 risk assessment matrixes and by utilising expert judgement. All risks identified in the Water UK study that are relevant to the company are initially assessed in this manner. All impacts from the study were analysed by relevant experts across the company, these were given likelihood and consequence scores for each timeframe 2020’s, 2050’s and 2080’s.

**Tier 2** – a semi-quantitative analysis. All the highest scoring impacts for each timeframe identified under tier 1 have been stripped out and analysed further. We have used expert judgement to assess these risks. However in following this methodology future iterations of our adaptation plan will seek to assign qualitative data to this assessment.

**Tier 3** – a fully quantitative analysis, where the probable performance of each option in managing the risk is quantified in terms of costs and benefits and, in some cases or where possible converted into monetary terms. It is very

<sup>16</sup> Climate adaptation: Risk, uncertainty and decision-making UKCIP Technical Report

<sup>17</sup> Climate adaptation: Risk, uncertainty and decision-making UKCIP Technical Report

unlikely that the company can carry out an assessment to this level at present due to lack of data and the high level of uncertainty around the climate change predictions. Added to this at present we not identified any additional high risk, high consequence impacts that have not been evaluated in our planning for the next 25 years.

#### **2.4. Evaluation of the costs and benefits of the proposed adaptation options**

In our climate change impact assessment we have not identified any additional risks that have not been covered in our strategic business planning. Therefore we have no need for immediate investment for adaptation outside of a small number of schemes already programmed in for the next AMP (asset management period). The company risk register and water safety plans already hold a complete breakdown of all company risks and the controls in place to deal with these. We have linked the hazards from the highest scoring climate change impacts to those found in the company risk register and water safety plan where possible. In future, when reviewing the climate change risk assessment, if we identify hazards that are not covered in our corporate risk assessments; these will be flagged up and added.

# Climate Change Adaptation Plan

## Part 3

Summary of risks which affect  
functions, mission aims and objectives

## Part 3 Index

- 3. Summary of risks which affect functions, mission aims and objectives**
  - 3.1. Strategic risks faced by the organisation**
  - 3.2. Short and long term Impacts of climate change**
    - 3.2.1. 2020's Short term risk**
    - 3.2.2. 2050's Medium term risk**
    - 3.2.3. 2080's Long term risk**
  - 3.3. High priority climate related risks**
    - 3.3.1. Impact D2 Higher daily and peak demand for garden watering as a result of drought**
    - 3.3.2. Impact D4 Lower river & borehole yields or reduced water quality arising as a result of drought**
    - 3.3.3. Impact T10 Increased algal growth and risk of microscopic organisms within the water supply system as a result in increased temperatures**
    - 3.3.4. Impact T12 Reduced raw water quality as a result of in increased temperatures**
    - 3.3.5. Impact T20 more extreme wetting and drying cycles arising as a result of increased summer temperatures**
    - 3.3.6. Impact T57 Acceleration of the deterioration in structures, buildings and machinery equipment as a result of higher peak and average temperatures**
    - 3.3.7. Impact F1 direct flooding (fluvial or surface) of assets leading to water resource asset loss**
    - 3.3.9. Impact F17 direct flooding (fluvial or surface) of assets leading to water supply network asset loss**
    - 3.3.10. Impact S1 Direct flooding, storm damage, coastal erosion or planned retreat of water resources assets resulting form sea level rise**
    - 3.3.11. Impact S2 Saline intrusion into water resource assets resulting from a rise in sea levels**

### **3.4. Opportunities as a result of climate change**

#### **3.4.1. Higher winter rainfall**

#### **3.4.2. More resilient infrastructure**

### **3. Summary of risks which affect functions, mission aims and objectives**

Climate change risks are one of many that face the company. We need to be proactive when dealing with all risks to the company and particularly when dealing with those that relate to climate change. The risk assessment for the purpose of this report has been at a high level to enable us to identify the areas that we need to focus on with regards to climatic impacts. In future iterations of the Climate Change Adaptation Plan (CCA), climate change risks will be analysed in more detail to ensure that we maintain our ability to cope with and adapt to future climatic conditions.

#### **3.1. Strategic risks faced by the organisation**

In Appendix 2 we list all the climate change impacts identified in the Water UK study. It was evident from the analysis of these risks that the most common risks facing the company were related to higher demands, reduced yields temperature increases and surface flooding.

#### **3.2. Short and long term Impacts of climate change**

The assessment of risks for the purpose of this report has made use of the three timeframes provided in the UKCIP09 scenarios 2020's, 2050's and 2080's. The highest scoring risks for each timeframe with the associated likelihood and confidence score are listed in Appendix 3.

##### **3.2.1. 2020's Medium term risk**

In the medium term we refer to our Strategic Direction Statement (SDS), Water Resource Management Plan, Drought Plan and our 2009 Periodic Review. We have not identified any risks to the company that have not been addressed in one of the before mentioned planning documents.

##### **3.2.2. 2050's Long term risk**

All climate change risks will be reassessed in more detail in the next round of Business Plans and Water Resources Plans. In the interim climate risks will be monitored and updated when necessary in the annual review of the Climate Change Adaptation Plan.

##### **3.2.3. 2080's Very long term risk**

There is a high degree of uncertainty surrounding the magnitude of the climate change impacts for this timeframe. We see higher risk scores for climatic impacts during this timeframe; this is down to increased possibility of the risks occurring.

### 3.3. High priority climate related risks

From our analysis of the timeframes 2020's, 2050's and 2080's we have selected the highest scoring climate change impacts faced by the company (table 3.3).

These have been analysed and displayed on a likelihood consequence matrix for the time periods 2020, 2050 and 2080.

A detailed description of each impact follows the table below. Each top priority risk has a number of potential hazards to the company; these and the control mechanism to mitigate each hazard are provided in the company risk register and Water Safety Plan (WSP).

The relevant risk register and WSP risk assessments for each of the highest scoring climate change risks are supplied under each impact description where applicable. We have not undertaken an analysis of costs for the purpose of this report. In future reviews this will be an option.

Our level of confidence in our estimations reduces moving into the future. This is due to the huge amount of uncertainty in the future climate scenarios. Confidence assessments for the top climate change impacts are provided for the highest priority impacts.

As a result of this report, climate change impacts have been added to the company risk register and will now assume part of our business as usual risk management practices.

**Table 3.3 Top scoring climate change impacts**

The risks listed in the table below represent those that had the highest score after the qualitative risk assessment. The qualitative risk assessment has been based on the Water UK study, A Climate Change Adaptation Approach for Asset Management (2007)<sup>18</sup>. These are explained in more detail in the following section.

| No     | ASSET LEVEL 2      | ASSET IMPACTED                          | REF | IMPACT TYPE | PRESSURE  | CONSEQUENCE FOR ASSETS OPERATIONS &                                      | CONSEQUENCE FOR SERVICE                |
|--------|--------------------|---|-----|-------------|---|--|--|
| 3.3.1  | WATER RESOURCES    | All Water Resources                     | D2  | DROUGHT     | Higher daily & peak demand for garden watering,                         | lower security of supply   | Reduction in levels of service         |
| 3.3.2  | WATER RESOURCES    | All Water Resources                     | D4  | DROUGHT     | Lower river & borehole yields or reduced water quality,                 | abstraction licences reduced or removed, reducing security of supply     | Reduction in levels of service         |
| 3.3.3  | WATER TREATMENT    | All Water Treatment                     | T10 | TEMP. RISE  | Higher temperatures   | more algal growth and micro-organisms in the water supply system         | higher drinking water quality risk     |
| 3.3.4  | WATER TREATMENT    | Treatment works                         | T12 | TEMP. RISE  | Higher temperatures   | lower raw water quality  | greater risk to drinking water quality |
| 3.3.5  | WATER NETWORKS     | Distribution networks incl. ancillaries | T20 | TEMP. RISE  | More extreme wetting and drying cycles                                  | greater soil movement, more pipe movement and bursts                     | Reduction in levels of service         |
| 3.3.6  | SITE-WIDE SERVICES | All Site wide Services                  | T57 | TEMP. RISE  | Higher average and peak temperatures                                    | accelerated deterioration of structures, buildings, machinery, equipment | Reduction in levels of service         |
| 3.3.7  | WATER RESOURCES    | All Water Resources                     | F1  | FLOOD       | Direct asset flooding   | asset loss   | service failure                        |
| 3.3.8  | WATER TREATMENT    | All Water Treatment                     | F11 | FLOOD       | Direct asset flooding   | asset loss   | service failure                        |
| 3.3.9  | WATER NETWORKS     | All Water Networks                      | F17 | FLOOD       | Direct asset flooding   | asset loss   | service failure                        |
| 3.3.10 | WATER RESOURCES    | All Water Resources                     | S1  | SEA LEVEL   | Direct asset flooding, storm damage, coastal erosion or planned retreat | asset loss   | service failure                        |
| 3.3.11 | WATER RESOURCES    | All Water Resources                     | S2  | SEA LEVEL   | Saline intrusion  | accelerated asset deterioration  | Service failure/reduction              |

<sup>18</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning 41414874 V1.0

### 3.3.1. Impact D2 Higher daily and peak demand for garden watering as a result of drought

This represents a high consequence low probability risk to the company if daily peak demand was greater than our ability to supply water it could lead to service failures thus lowering our security of supply.

In the past our system has experienced high peak demands during the summer months mainly attributed to garden watering and large numbers of summer visitors. We have a residential profile that is dominated by the most affluent socio-demographic groups, giving rise to a high number of detached households with gardens<sup>19</sup>. The estimated number of visitors during the peak months of July and August has been estimated at 50 000. This number excludes day-trippers and is equivalent to 12% of the usual residential population. Our Water Resources Plan (WRP)<sup>20</sup> focuses on managing this demand during peak periods. These plans project 25 years into the future and are reviewed each year with a new plan submitted every 5 years. This means that we are constantly forecasting 25 years ahead of where we are at present ensuring that we proactively deal with changes in demand as climatic conditions change and knowledge of future conditions improves. We will use the latest UKCIP projections when compiling our next WRP.

Our current WRP does not foresee any need to develop any new resources to deal with peak summer demands during in the next 25 years. We continue to manage demand through a programme of metering, targeted water efficiency activity and a continued focus on leakage control. We continue to monitor trends in peak summer demand and use the latest population data when

<sup>19</sup> Bournemouth & West Hampshire Water, Drought Plan October 2007

<sup>20</sup> Bournemouth & West Hampshire Water, Water Resources Management Plan Nov 2009

compiling our forecasts. As can be seen in the chart below we have experience a year on year reduction in demand since 2004.

As a result of statutory long term planning it is extremely unlikely that a situation would arise where supply outstrips demand as this would be identified in future forecasts and measures put in place to deal with the situation before it arises.

As can be seen from the chart above the likelihood of the impact D2 occurring does increase when we move beyond 2050. This is due to the huge amount of uncertainty around the predicted climatic conditions that we are going to experience during this timeframe.

3.3.2. Impact D4 Lower river & borehole yields or reduced water quality arising as a result of drought

We operate a number of sources of water, as shown in table below. In dry conditions, the available capacity of each source is determined by river flow, groundwater level, abstraction licence or treatment capacity, and is known as the deployable output. In planning terms, we also need to account for plant availability constraints, such as system failures or source pollution. The deployable output figures in the table have therefore been adjusted to show the estimated water available for use in dry weather conditions, on average and in the week of peak demand. These were derived using guidance provided by the Environment Agency (EA).

It is customary in planning for the long term to incorporate an allowance for uncertainty – in water resources planning this allowance is called headroom. Headroom is defined as *the minimum buffer that a prudent water company should allow between supply and demand to cater for specified uncertainties in the supply demand balance*. In compiling the supply demand balance, the headroom allowance is added to the demand forecast, and the resulting total is compared against the available supply. On the whole the water available for use (WAFU) for the company does not change over the WRP period with no anticipated deficits in either the dry year or critical period scenario (up to 2034/35).

Beyond the planning scenario the likelihood of experiencing a drop in available resource does increase slightly, this is due to the increased uncertainty. The nature of our sources means that we are reliant on their instantaneous performance; however we have developed bankside storage to deal with peak demand and have the option to develop further storage in future.

All our sources are partially or wholly reliant on groundwater, this is an advantage to the company as the chalk aquifer that feeds these acts as a reservoir which recharges over the winter. Future scenarios tend to show that winter rainfall is to increase thus putting our sources in an even more robust position. Further to this we have also seen a reduction in peak demand over the past few years (see chart 3.3.1) which can be partially attributed to increasing customer awareness of water resource issues and changing customer behaviour. We are monitoring these trends closely to gain a greater understanding of the drivers of these changes and if they will be permanent.

In the company Water Resources Management Plan (WRMP) we have analysed the effects of climate change on both our surface and groundwater resources.

#### *Surface water*

This was done following the Draft Protocol Guidance (ref NWA/NSR v5) which was provided with the WRMP guidelines for surface water.

The long-term flow series for both the River Avon and River Stour have been derived for the WRMP using a methodology based on that developed in the UKWIR CL04 surface water reports<sup>2223</sup>. Both sources are license constrained and for all sources it was concluded that, at the time of analysis using the UKCIP climate change scenarios there was no need to allow for climate change impacts on water availability.

#### *Groundwater*

The UKWIR critical period groundwater yield methodology<sup>24</sup> for groundwater yields was used to determine the effects of the UKCIP 2020's medium emissions scenarios on aquifer levels.

It was concluded that there was likely to be no impact on our groundwater sources deployable output (DO) during the WRMP planning horizon.

This conclusions for both surface and groundwater sources are to be kept under review over the course of AMP 5 and in the light of any new research or any new regulatory guidance.

### 3.3.3. Impact T10 Increased algal growth and risk of microscopic organisms within the water supply system as a result in increased temperatures

This is not a high consequence risk however it could possibly occur in the short term, with an increasing probability of occurrence as we move into the future. We employ slow sand filters for the treatment of drinking water. Our filter beds are prone to algal build up during times of high temperature with the increasing prevalence of higher summer temperatures in future this could pose a potential problem. Another impact that arises from increased algal growth is the reduction of the capacity of slow sand filters to filter adequate volumes of water due to blinding. This has a potential impact on our ability to supply enough water to meet demands during peak periods.

**Table 3.3.3 A. Relevant risk assessments from BWH Water Safety Plan (WSP)**

| WSP ID    | Hazardous event                   | Hazard                                    |

|-----------------------------------|---|
| Medium,                           | We have experienced these impacts in the past |

### 3.3.4. Impact T12 Reduced raw water quality as a result of in increased temperatures

Increased peak summer temperatures are a prominent feature of the climate of the future. Higher temperatures will also occur for longer periods of time leading to increased biological activity in raw water. The slow sand filters used in our main treatment works are susceptible to algal blinding during periods of increased temperatures.

**Table 3.3.4 A. Relevant risk assessments from BWH Water Safety Plan (WSP)**

| WSP ID    | Hazardous event                                | Hazard                             |

|-----------------------------------|---|
| Medium                            | We have experienced these impacts in the past |

### 3.3.5. Impact T20 more extreme wetting and drying cycles arising as a result of increased summer temperatures

Changes in wetting and drying cycles may have the effect of increasing ground movement in certain soil types. This is of particular concern to our underground network assets causing a higher frequency of bursts. This has the effect of increasing leakage and reducing our levels of service.

As stated in our PR09 business plan<sup>26</sup> we are increasing the rate of mains renewal and associated equipment. Our long term strategy is to move towards a mains renewal rate of approximately 1% of the entire network per annum. This being the level of mains renewal needed to maintain stable serviceability and sustainability of assets over the long term. From analysis work done during the periodic review it was decided that in the medium term mains renewal rates could increase to approximately 0.43% with a view to moving to 1% renewal rate in the future.

Increased ground movement in the future will have an impact on the asset life of underground assets, rendering them shorter and thereby having the effect of increasing the percentage of the network we need to renew in order to achieve stability and serviceability levels desired.

### 3.3.6. Impact T57 Acceleration of the deterioration in structures, buildings and machinery equipment as a result of higher peak and average temperatures

All company assets are designed to cope with current climatic conditions with tolerances built in to cope with extremes. As we move into the future extreme climatic events will become more frequent and prolonged. We need to assess the impact that this will have on our assets. From analysis of past extremes we can see that we have in the past experienced conditions similar to those expected under future climate change scenarios. We are ideally placed to deal with these impacts on our assets through our long term asset management planning. We have no plans for building of any new long life above ground assets in the medium term. As the industry plans in 5 year periods we are provided with the ideal opportunity to adapt our assets over time to cope with changing climatic conditions through refurbishment and replacement of these assets.

**Table 3.3.6 A. Relevant risk assessments from BWH risk register**

### 3.3.7. Impact F1 direct flooding (fluvial or surface) of water resource assets leading to water resource asset loss

The major sources of water for the company are located on the Hampshire Avon and the Dorset Stour. All rivers are prone to flooding at some times just as extreme rainfall events could lead to possible surface flooding of assets. The need for water companies to review the risk posed to critical assets has been highlighted on a number of occasions in the past. Although flooding is just one possible cause of failure for critical assets the company has been working for some years to increase the resilience of our network of sources, treatment works and distribution infrastructure. This has been done by ensuring the robustness of power supplies, providing inter-zonal links and ensuring that we have adequate storage.

To deal with the risk posed by flooding at key assets we have undertaken a review of the likelihood of this occurring and the consequences to service if such an event were to occur. This review identified individual parts of three water treatment works where there is a risk of flooding following an extreme rainfall event. Two of these are part of major treatment works and therefore their failure would have serious consequences.

From the principles set out in Ofwat's PR09/12 and consultation with the Environment Agency (EA) regarding predicted flood levels for certain return periods, we have put measures in place to mitigate these risks in the current 5 year asset management (AMP) period. As the interventions are small and only cover small parts of the cost of carrying out this work is relatively low.

As climate change scenarios change over time and the uncertainty around these scenarios is reduced we will review our exposure to flood risk and make any new investment we deem necessary.

**Table 3.3.7 A. Relevant risk assessments from BWH Water Safety Plan (WSP)**

| WSP ID     | Hazardous event            | Hazard   |
|------------|----------------------------|--|
| RA-WIM-32  | Loss of power              | Plant failure                                      |
| RA-WIM-33  | Catastrophic plant failure | Plant failure                                      |
| RA-WIM-42  | Site flooding              | Flooding of critical plant rendering it inoperable |
| RA-WOOD-33 | Catastrophic plant failure | Plant failure                                      |
| RA-STAN-32 | Loss of power              | Plant failure                                      |
| RA-STAN-33 | Catastrophic plant failure | Plant failure                                      |
| RA-KMA-47  | Site flooding              | Flooding of critical plant rendering it inoperable |
| RA-AMP-42  | Site flooding              | Flooding of critical plant rendering it inoperable |

**Table 3.3.7 B. Relevant risk assessments from BWH risk register**

| Risk register ID | Hazard   |
|------------------|--|
| 7                | Major water supply failure (quality) resulting in compensation |
| 91               | Natural flooding of a site (Knapp Mill, Longham, Stanbridge)   |

| Level of confidence in assessment | Comments   |
|-----------------------------------|--|
| Medium                            | More data and further analysis of flooding impacts is needed |

### 3.3.8. Impact F11 direct flooding (fluvial or surface) of treatment assets leading to water treatment asset loss

Water resource and water treatment assets are integrally linked; you cannot supply water if it cannot be treated. The likelihood of the loss of a treatment works through flooding is low however the consequence of such an event would be extremely high. We will continue to monitor and reassess the impact of flooding on these assets. See section 3.3.7 above for details regarding flood protection measures that are being undertaken at present. We will continue to review our exposure to this risk in future business planning and make any new investment we deem necessary.

**Table 3.3.8 A. Relevant risk assessments from BWH Water Safety Plan (WSP)**

| WSP ID     | Hazardous event                           | Hazard   |
|------------|---|--|
| RA-AMP-36  | Plant flow                                | Too high flow stressing treatment capability       |
| RA-AMP-42  | Site flooding                             | Flooding of critical plant rendering it inoperable |
| RA-KMA-4   | Storm events causing agricultural run off | Stress treatment capability                        |
| RA-KMA-47  | Site flooding                             | Flooding of critical plant rendering it inoperable |
| RA-STAN-32 | Loss of power                             | Plant failure                                      |
| RA-STAN-33 | Catastrophic plant failure                | Plant failure                                      |
| RA-STAN-36 | Plant flow                                | Too high flow stressing treatment capability       |
| RA-WOOD-33 | Catastrophic plant failure                | Plant failure                                      |
| RA-WOOD-36 | Plant flow                                | Too high flow stressing treatment capability       |
| RA-WOOD-42 | Site flooding                             | Flooding of critical plant rendering it inoperable |
| RA-ALD-36  | Catastrophic plant failure                | Plant failure                                      |
| RA-ALD-39  | Plant flow                                | Too high flow stressing treatment capability       |
| RA-WIM-36  | Plant flow                                | Too high flow stressing treatment capability       |

**Table 3.3.8 B. Relevant risk assessments from BWH risk register**

| Risk register ID | Hazard   |
|------------------|--|
| 7                | Major water supply failure (quality) resulting in compensation |
| 91               | Natural flooding of a site (Knapp Mill, Longham, Stanbridge)   |
| 99               | Water quality failure including contamination                  |

| Level of confidence in assessment | Comments   |
|-----------------------------------|--|
| Medium                            | More data and further analysis of flooding impacts is needed |

### 3.3.9. A. Impact F17 direct flooding (fluvial or surface) of network assets leading to water supply network asset loss

Our network is not particularly vulnerable to flooding however the consequence of the loss of network assets through flooding is high with many of our customers being affected. We will review our exposure to this risk in future business planning and make any new investment we deem necessary.

**Table 3.3.9 A. Relevant risk assessments from BWH risk register**

| Risk register ID | Hazard   |
|------------------|--|
| 193              | Loss of distribution network, supply zone  |
| 194              | Loss of distribution network, water management zone  |
| 205              | Missing of leakage targets   |
| 206              | Long run loss of a trunk main  |
| 212              | DG2 failure (poor pressure)  |
| 213              | DG3 failure (interruption to supply)   |
| 215              | Flooding properties  |
| 770              | Contamination of water supply (underground)  |
| 754              | Water flooding the road  |
| 490              | Trunk or other main failure taking a long time to repair resulting in a loss of supply to a significant number of properties |
| 92               | Trunk main failure (Matchams/Longham, 3 x Longham/Alderney)  |
| 93               | Loss of Fawley main  |

| Level of confidence in assessment | Comments   |
|-----------------------------------|--|
| Medium                            | More data and further analysis of flooding impacts is needed |

### 3.3.10. Impact S1 Direct flooding, storm damage, coastal erosion or planned retreat of water resources assets resulting from sea level rise

Rising sea levels pose a significant threat to all communities living near the sea. The probability of sea level rise affecting the company assets is low however the consequence of such an occurrence is high. The probability of occurrence increases with time from a very low probability in the next 25 years to it becoming a possibility by 2080.

One of our large treatment works is situated 1 km from the tidal limit on the river Avon and therefore there is a very slight possibility that in the distant future there could be some effect on the works as a result of the effects of sea level rise increasing the flooding potential of the river when high flows and high tides coincide.

#### Sea level rise ranges <sup>27</sup>

| Administrative<br>Devolved Region | or<br>Assumed<br>Vertical<br>Movement<br>(mm/yr) | Land<br>rise (mm/yr) | Net sea level<br>rise (mm/yr)<br>1990-2025 | Net sea level<br>rise (mm/yr)<br>2025-2055 | Net sea level<br>rise (mm/yr)<br>2055-2085 | Net sea level<br>rise (mm/yr)<br>2085-2115 |
|-----------------------------------|--|----------------------|--|--|--|--|
| South West and Wales              | - 0.5  |                      | 3.5  | 8.0  | 11.5                                       | 14.5                                       |
| Rise                              |  |                      | 122.5mm                                    | 240mm                                      | 345mm                                      |  |
| Total predicted sea<br>level rise |  |                      | 122.5mm                                    | 362.5mm                                    | 707.5mm                                    |  |

The predicted sea level rise values in the table above give an indication as to the extent of sea level rise in our region. The actual impacts are unknown and

<sup>27</sup>

<http://www.defra.gov.uk/environment/flooding/documents/policy/guidance/fcdpag/fcd3climate.pdf>

detailed modelling still has a great degree of uncertainty around the possible outcomes. The effects of sea level rise on the tidal limits on rivers is extremely variable as there are a huge number of parameters that need to be taken into account when trying to determine the extent of the upstream movement. Sea level rise will be occurring gradually over time and we will continue to monitor the extent of these effects. This will allow us to act with certainty once the impacts of sea level rise on our water resources assets are fully known.

**Table 3.3.10 A. Relevant risk assessments from BWH Water Safety Plan (WSP)**

| WSP ID    | Hazardous event | Hazard   |
|-----------|-----------------|--|
| RA-KMA-47 | Site flooding   | Flooding of critical plant rendering it inoperable |

**Table 3.3.10 B. Relevant risk assessments from BWH risk register**

| Risk register ID | Hazard   |
|------------------|--|
| 91               | Natural flooding of a site (Knapp Mill, Longham, Stanbridge) |
| 94               | Loss of primary filtration                                   |
| 74               | Loss of Knapp Mill high lift                                 |

| Level of confidence in assessment | Comments                             |
|-----------------------------------|--------------------------------------|
| Medium                            | This is an extremely unlikely impact |

### 3.3.11. Impact S2 Saline intrusion into water resource assets resulting from a rise in sea levels

Saline intrusion is a high consequence very low probability risk. It is highly unlikely that company assets will be affected by saline intrusion. One of the largest company works is situated 1km from the tidal limit but due having a weir on the downstream side of the intake, sea level rise will have to be significantly higher than the estimated maximum predicted (see c.10). All other water resources assets are situated high enough above mean sea level not to be affected by this impact.

We will continue to monitor the impacts of sea level rise on our essential infrastructure and will act to mitigate any risks identified during future AMP periods.

**Table 3.3.11 A. Relevant risk assessments from BWH risk register**

| Risk register ID | Hazard   |
|------------------|--|
| 91               | Natural flooding of a site (Knapp Mill, Longham, Stanbridge)   |
| 193              | Loss of distribution network, supply zone  |
| 194              | Loss of distribution network, water management zone  |
| 205              | Missing of leakage targets   |
| 206              | Long run loss of a trunk main  |
| 212              | DG2 failure (poor pressure)  |
| 213              | DG3 failure (interruption to supply)   |
| 770              | Contamination of water supply (underground)  |
| 490              | Trunk or other main failure taking a long time to repair resulting in a loss of supply to a significant number of properties |

| Level of confidence in assessment | Comments  |
|-----------------------------------|---|
| Medium                            | It is extremely unlikely that saline intrusion will affect service/assets |

### **3.4. Opportunities as a result of climate change**

#### **3.4.1. Higher winter rainfall**

All of our sources are reliant on winter recharge; the increase in winter rainfall will increase the water available in the summer.

#### **3.4.2. More resilient infrastructure**

In future we will design our infrastructure to cope with a greater range of impacts. This will serve to increase the resilience of our infrastructure and ensure that we maintain good levels of service.

Climate Change Adaptation Plan  
Part 4  
Actions proposed to address risks

## **Part 4 Index**

- 4. Actions proposed to address risks**
  - 4.1. Adaptation actions for the top priority climate change risks**
    - 4.1.1. Risk Assessment**
  - 4.2. Implementing adaptation into business practice**
  - 4.3. Costs of adaptation measures**
  - 4.4. Reduction of risk as a result of adaptation**
  - 4.5. Embedding climate change risk management into the organisation**
    - 4.5.1. Initiate change before the threat becomes severe**
    - 4.5.2. Allow sufficient time and resources for implementation, particularly in relation to core changes**
    - 4.5.3. Build a broad base of change agents within the company**
    - 4.5.4. Alter work processes to establish changes**
    - 4.5.5. Build internal capacity, and avoid long-term dependence on external entities**
    - 4.5.6. Seek to support and inform change initiatives through existing professional networks**
    - 4.5.7. Expand on established routines and competencies**
    - 4.5.8. Communicate early, fully and often**
    - 4.5.9. Framework for implementing climate change adaptation into the everyday running of the business**

## **4. Actions proposed to address risks**

### **4.1. Adaptation actions for the top priority climate change risks**

In order to ensure the company is able to adapt to the changing climate, we need to ensure that climate change risk assessment is clearly embedded in all corporate risk appraisal, business planning and decision making.

#### **4.1.1. Risk Assessment**

The qualitative risk assessment that was completed as part of this report was the beginning of this process. Now that we have an understanding of the possible future climate impacts, we need to ensure that the business has the capacity to adapt to the increased exposure to these risks that we expect in the future. For a water company the loss of the ability to supply water is our top priority risk, climate change will have a significant impact on water resources. One of the major strategic themes of our business plans is the use of demand management to maintain our healthy supply demand balance. We have a focus on metering, leakage reduction and water efficiency work to achieve this end. We will continue to monitor the effects of climate change on our supply demand balance and plan accordingly.

Although our qualitative risk assessment has not identified any climate change risks that fall outside of those already considered and evaluated in our corporate risk assessment documents and regulatory planning, it does not mean that this will always be the case. We need to ensure that all areas of our business take the future climate into account in all aspects of decision making, planning and day to day operations. This section sets out the framework for our climate change strategy. During our next asset planning (AMP) period we need to determine where our adaptive capacity is weakest and ensure that we address these weaknesses if they are found to reduce our resilience to risk.

### **4.2. Implementing adaptation into business practice**

Building principles of sustainability and adaptability into the operation of our business ensures that we can achieve our goals of maintaining and improving service levels. As we have a corporate approach to risk identification and monitoring, the review of the climate change related risks must become a part of the process.

Table 4.2 below gives an outline of the mechanisms and processes we have in place to review risks in the corporate structure. We will now include climate change risks in all these assessments.

**Table 4.2**

| Level     | Process                                       | Frequency     | Comments   |
|-----------|---|---------------|--|
| Strategic | Formal review of risk register and actions    | 2 per year    | Formal process of review   |
| Strategic | Review of key standards and policy objectives | As necessary  | Based on political, regulatory and customer views                    |
| Company   | Business plan                                 | Every 5 years | Climate impacts to be taken into account for all business activities |
| Company   | Water Resource Plan                           | Annual        | Already takes climate change into account                            |
| Company   | Review of Water Safety Plan                   | Annual        | Climate change impacts to be included                                |

Water services management teams meet monthly for an informal review of Water Safety Plans, Distribution operation and management strategy (DOMS) and the Capital Maintenance programme. Climate change risks will henceforth also be reviewed during these meetings.

### 4.3. Costs of adaptation measures

During our next Asset Management Plan (AMP) period we will completely review the risk assessment of climate change impacts. If we identify areas where work is needed these will be costed as part of our usual business planning. We do not have any capital schemes dealing specifically with climate change risks in this AMP period.

### 4.4. Reduction of risk as a result of adaptation

This is one of the most important strategic goals of the company; all the regulatory mechanisms that control the operation of a water company encourage the building of resilience into operations and assets. We are continually evaluating risks and investigating ways to ensure we can operate to the standards of service expected by our customers in all situations.

### 4.5. Embedding climate change risk management into the organisation

In order to embed climate change risk management across our organisation we intend to follow the steps listed below.<sup>28</sup>

#### 4.5.1. Initiate change before the threat becomes severe

Through the process of completing the climate change adaptation plan we have identified the main climatic impacts that are expected to affect our business operations. Through the implementation of climate change adaptation into the everyday running of the business we will have the capacity to identify future risks and act to implement an adaptation action.

<sup>28</sup> Business for social responsibility: A Three-Pronged Approach to Corporate Climate Strategy

**4.5.2. Allow sufficient time and resources for implementation, particularly in relation to core changes**

Climate change affects all aspects of our organisation and therefore we can deal with any risk identified in our various reviews that is not acceptable to the business. These risks can then be addressed in our Periodic Reviews and Water Resource Plans

**4.5.3. Build a broad base of change agents within the company**

We need to build capacity across the entire business to deal with climate related risks. We will initiate a yearly report to educate and update all relevant parties across the business as to the latest climate change assumptions. We will also investigate educational opportunities for staff in order for them to be able to identify risks in their area of operation and collect good data for future quantitative analysis.

**4.5.4. Alter work processes to establish changes**

We need to initiate more comprehensive data management with regards the effects of extreme weather on our assets and work practices.

**4.5.5. Build internal capacity, and avoid long-term dependence on external entities**

This is an important part of our strategy to ensure that our company is flexible to risk. In our PR09 business plan we point out the benefits of producing our own energy and continue to investigate our options in this regard. We also identify our essential suppliers and the impacts of a loss of one of these and controls in place to deal with such an occurrence in our corporate risk management strategy.

**4.5.6. Seek to support and inform change initiatives through existing professional networks**

We are active members of industry wide networks that deal with climate change and its impacts.

**4.5.7. Expand on established routines and competencies**

Change is most effective when disruption to other business processes is minimal. We seek to enhance current processes such as Periodic Reviews, Water Resources Management Plans, Drought Plans, June Returns, reviews of corporate risk assessment and Water Safety Plans to ensure that climate change impacts are always taken into account.

**4.5.8. Communicate early, fully and often**

By embedding climate change goals and targets into regular communications with both staff and customers we hope to communicate our commitment to increasing our resilience to future climate impacts. We hope that this will enable them to make informed decisions regarding adaptation to climate change in their personal capacity.

#### **4.5.9. Framework for implementing climate change adaptation into the everyday running of the business**

In order to ensure the resilience of the organisation the adoption of climate change adaptation needs to be throughout the entire organisation. We will begin to implement this through a number of steps.

##### *Step 1 Raise awareness*

We will produce a summary of the climate change adaptation plan to be distributed to all members of staff. Further information and yearly updates will be provided in company publications. A briefing on climate change adaptation actions and progress will be reported in the annual staff briefing.

##### *Step 2 Initiate organisational learning*

Ensuring our members of staff are educated about the effects that future climate change will have on the business will ensure that climatic change becomes embedded in the culture of the organisation. By educating key staff members will also lead to better data collection and allow for better analysis of risks in the future.

##### *Step 3 Changing standards and developing company policy*

Climate change adaptation needs to be included in our current corporate risk appraisal process. We need to ensure that the executive monitor the outputs of the Climate Change Adaptation Plan

##### *Step 4 Improve data collection and monitoring*

We need to ensure that climate data is collected and the effects of climatic conditions on operations are monitored by all areas across the company. This will create an evidence base to help with future decision making.

##### *Step 5 Create working partnerships*

We need to inform all our stakeholders of our climate change adaptation measures that we have in place. Further to this engaging with suppliers and customers to ensure that they are taking climate change impacts into account will improve resilience of all parties. Linking with other reporting authorities in our area through initiatives such as the South West Climate Change Adaptation Mapping Resource website will allow for the sharing of information across various sectors.

**Table 4.5.9 Implementation matrix**

| Step   | Activity   | Responsible department/person   | Action   | Due by     |
|--|--|---------------------------------|--|------------|
| 1 Raising awareness                                | Ensure all staff are aware of the climate change impacts on the business and what is being done                          | Regulation                      | Produce a notice for all staff outlining our climate change adaptation plan. Ensure that staff are kept up to date of yearly reviews of the plan in company publications | March 2011 |
| 1 Raising awareness                                | Ensure all customers are aware of the companies CCA strategy   | Regulation                      | Provide an summary of the climate change adaptation strategy in customer publications  | March 2012 |
| 2.Organisational learning                          | Ensure all key staff members are educated about the impacts of climate change and how it affects their area of operation | Regulation                      | Initiate and annual review meeting with heads of departments to review climate change adaptation report  | Jan 2012   |
| 3 Changing standards and developing company policy | Ensure climate change adaptation is implemented into all risk, standards and key policy reviews                          | Executive                       | Change these processes and procedures to ensure CCA is taken into account  | July 2011  |
| 4. Data collection and monitoring                  | Formal yearly review of CCA plan   | Regulation                      | Review CCA plan to ensure that all assumptions and actions are up-to-date.   | Jan 2012   |
| 4. Data collection and monitoring                  | Ensure climatic data is recorded and effects of conditions on areas of operation are noted                               | Heads of departments/Regulation | Initiate yearly departmental climate reports to go into a company climate change evidence base   | March 2012 |
| 5 Creating working partnerships                    | Ensure key suppliers and customers are informed about our CCA strategy.  | Corporate services              | Provide access to CCA report and yearly updates  | March 2011 |
| 5 Creating working partnerships                    | Ensure that other reporting authorities are aware of our CCA plan  | Regulation                      | Publish CCA report on the South West Climate Change Adaptation mapping resource website  | Jan 2011   |

# Climate Change Adaptation Plan

## Part 5

### Uncertainties and assumptions

## **Part 5 Index**

### **5. Uncertainties and assumptions**

#### **5.1. Main uncertainties in the evidence, approach and method used in the adaptation programme and the operation of the organisation**

##### **5.1.1. Evidence**

##### **5.1.2. Approach**

##### **5.1.3. Method**

#### **5.2. Assumptions that have been made when devising the programme for adaptation**

##### **5.2.1. The water industry**

##### **5.2.2. Emissions scenarios**

##### **5.2.3. Levels of service**

##### **5.2.4. Assessment of impacts**

##### **5.2.5. Implementation of policies and procedures**

## 5. Uncertainties and assumptions

We have a general idea of what conditions to expect however, projecting 50 plus years into the future presents us with a large degree of uncertainty. In order to get an idea of future conditions we have made a number of assumptions about future impacts facing the company. We acknowledge that these assumptions could change in light of new information and therefore we have mechanisms in place to allow for the assumptions used in this report to be reviewed and updated. This will ensure that we remain flexible and resilient to potential future hazards facing the organisation.

### 5.1. Main uncertainties in the evidence, approach and method used in the adaptation programme and the operation of the organisation

The main uncertainties faced by the company are linked to the large variations in future climate scenarios and the robustness of data used to analyse the effects of climate on operations.

#### 5.1.1. Evidence

The impacts of climate change on the company have been taken from the MWH-Water UK study<sup>29</sup>. This provides general impacts for all water companies and therefore gives a broad range of possible impacts that could be experienced by a water company. Due to these impacts not being company specific there is a possibility that localised impacts could arise that have not been covered in the study.

Data relating to the effects of climatic conditions on operations is not robust across all areas of the business. In future we need ensure that relevant data is collected in order to allow for more quantitative analysis.

#### 5.1.2. Approach

Our approach to climate change adaptation allows climate change risk to be managed through multiple interventions over time. Large capital schemes require good data and need a high level of confidence that the solution will be successful and an efficient use of money. In certain cases, such as for very long life assets a more favourable solution sometimes requires a single intervention. However the uncertainty around the future conditions and current level of data quality constrains us to following a step by step approach to manage climate change risks.

---

<sup>29</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning 41414874 V1.0

### **5.1.3. Method**

Where possible we have followed the UKCIP decision making framework when evaluating the impacts of climate change on our business. Our qualitative risk assessment has been carried out by relevant experts across the company. This was done by evaluating the impacts identified in the Water UK study in terms of the UKCIP 09 climate projections. In future iterations of the CCA plan we need to ensure more quantitative analysis is undertaken of both the predicted climatic conditions and the impact that these will have on the operation of the business.

### **5.1.4. Operation of the organisation**

We are a small and local company compared to most other water which does increase operational risk slightly. Due to the small size of the company there are key staff members across the organisation that hold valuable information and expertise that is vital to the carrying out of our functions. This is especially the case when determining the effects of extreme weather on various areas of the business.

This information needs to be recorded and stored in order that the organisation is less reliant on these members of staff. This plan will serve as a catalyst to improve the way operational data is stored and managed with regards to the effects of extreme weather.

## **5.2. Assumptions that have been made when devising the programme for adaptation**

### **5.2.1. The water industry**

We assume that the water industry will exist in future in its current form with the same regulators and regulatory regime that we currently experience.

### **5.2.2. Emissions scenarios**

Future climatic conditions will result from an atmospheric carbon content equal or less than the medium emissions scenarios provided by UKCIP. We assume that the government will achieve the targets set in the Climate Change Act 2008 to reduce emissions by 80% by 2050.

### **5.2.3. Levels of service**

We will continue to maintain or improve our levels of service based on the wishes of our customers and key stakeholders.

### **5.2.4. Assessment of impacts**

Assessments of impacts on areas of operation have been carried out by experts in those fields and their judgement of the impacts and effects constitutes the best possible information available at present.

#### **5.2.5. Implementation of policies and procedures**

We assume that the procedures we are putting in place to mainstream climate change adaptation into the everyday decisions and planning will be effective in achieving this end. We will review these procedures on a regular basis to ensure that climate change adaptation becomes integral to the operation of the business.

Climate Change Adaptation Plan  
Part 6  
Barriers to adaptation and  
interdependencies

## **Part 6 Index**

### **6.1. Barriers to implementing our adaptation programme**

#### **6.1.1. Behaviour change**

#### **6.1.2. Reliability of data**

#### **6.1.3 Regulatory constraints**

### **6.2. How these barriers are being addressed**

#### **6.2.1. Addressing behaviour change**

#### **6.2.2. Addressing the reliability of data**

#### **6.2.3. Addressing regulatory constraints**

### **6.3. Interdependencies**

#### **6.3.1. Customers**

#### **6.3.2. Suppliers**

#### **6.3.3. Employees and shareholders**

#### **6.3.4. Government Defra and policy makers**

#### **6.3.5. Regulators**

## 6. Barriers to adaptation and interdependencies

### 6.1. Barriers to implementing our adaptation programme

Implementation of the climate change adaptation plan is essential if we are to ensure the resilience of our business. We have not at present identified any immediate actions that need to be carried out to deal with a risk to the business arising from climate change. Implementing the programme is a process of setting up mechanisms within the organisation that will allow for accurate monitoring and evaluation of the impacts of climate on the business and for this to be successful the following barriers will need to be overcome.

#### 6.1.1. Behaviour change

This report serves to highlight the areas where we could expect an impact in future. The significance of this is that we need to put in place measures to ensure that we are constantly monitoring and evaluating the effects of climate on our everyday operations. An important aspect of getting these measures in place across the business is the behavioural change needed in staff. The entire organisation needs to buy in to the concept of climate change adaptation in order to ensure resilience to the impacts.

According to the Defra report “Mobilising individual behavioural change through community initiatives: Lessons for Climate Change”.<sup>30</sup> Mobilising support for changing behaviour presents difficulties because; to get communities to take these behaviours on board the issue needs to be, locally relevant, have known beneficiaries and benefits from the action. When we contrast these with climate change issues, these impacts are long term, the benefits accrued are unknown and the actions undertaken by the individual make little difference when compared to the scale of the threat.

#### 6.1.2. Reliability of data

Sound data is needed to ensure that we are following the correct programme of measures in our climate change adaptation strategy. If the data used to determine our strategy is unreliable we will not be able to make informed decisions. This will lead to incorrect and unsuitable actions being taken or no action being taken when action is needed.

---

<sup>30</sup> Mobilising individual behavioural change through community initiatives. Lessons for Climate Change Report by the Centre for Sustainable Energy (CSE) and Community Development Xchange (CDX) for; Department for Environment, Food and Rural Affairs, Communities and Local Government, Department of Trade and Industry, Department for Transport and, Her Majesty's Treasury. February 2007

### **6.1.3. Regulatory constraints**

All water companies are subject to a high degree of regulatory scrutiny. When making any investment decisions, we have to prove that our actions are justified and cost beneficial. We also need to use our resources in the most efficient manner. Therefore we need to be certain that when an investment decision is made it is based on the best evidence possible. Due to the uncertainty around the predicted future conditions and lack of data in certain areas, it becomes difficult in certain cases to justify actions that may be needed to address future climate change.

We need to maintain good communications with our various regulators and ensure that they are communicating with one another. As a result of our various regulators having their own specific areas of interest there is a possibility that in future an output from one regulator may contradict that required by another.

### **6.1.4. Carbon Impact**

Many adaptation measures that will be required in future may be hard engineering solutions. These may have a significant carbon footprint and thereby accelerate climate change

## **6.2. How these barriers are being addressed**

### **6.2.1. Addressing behaviour change**

To overcome the issue of staff stakeholder buy in we are putting in place measures to educate staff this will be done through awareness raising and organisational education initiatives.

### **6.2.2. Addressing the reliability of data**

We are introducing new procedures for the collection of climatic data; part of improving our data collection is linked to educating the staff to highlight the importance of the data that they are collecting. In future iterations of the climate change adaptation plan we will then be able to do more quantitative analysis, which will enable us to highlight impacts that need to be addressed in future regulatory planning processes.

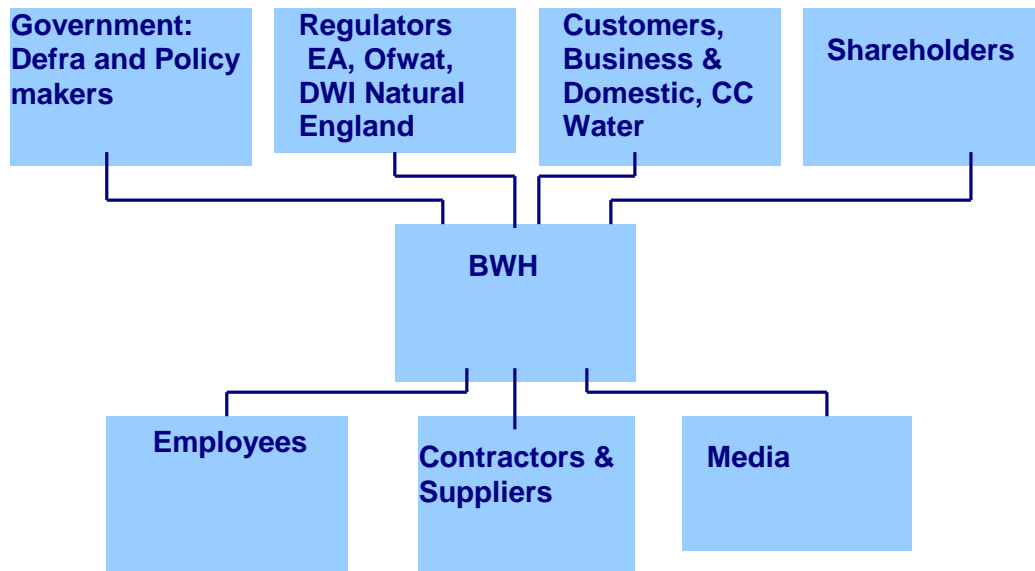

### **6.2.3. Addressing regulatory constraints**

By improving the collection of climate data across the organisation we will be able to provide better quantitative analysis for future regulatory price reviews. By communicating in an open manner with our regulators we hope to avoid situations where outputs required by different regulators are at odds.

## **6.3. Interdependencies**

Climate change has wide ranging effects on our society. As our customers, suppliers and other stakeholders depend on us, as we are in turn depend on them.

## 6.3 Key stakeholders

### 6.3.1. Customers

We provide an essential public service to our customers. The way that our customers use water directly affects our response to extreme weather conditions. Customer side interventions form an integral part of our demand management strategy, therefore we are reliant on customers reducing their water usage to manage peak summer demand.

### 6.3.2. Suppliers

We have risk management procedures in place for the loss of essential suppliers; these are detailed in the Water Safety Plan and Company Risk Register. However we need to ensure that our key suppliers are also resilient to the effects of climate change to ensure that we can maintain our levels of service under all conditions and only resort to our other contingencies in the most extreme circumstances.

### 6.3.3. Employees and shareholders

Our employees and shareholders depend on the functioning of the business for their livelihood. The business in turn needs finance and manpower to carry out its functions. Both staff and shareholders need to be aware of the issues faced by the company with regards to dealing with climate change. The first two steps of our climate change adaptation plan implementation strategy involve raising awareness and organisational learning, which will facilitate this. Having staff and shareholders support in delivering on climate change adaptation strategy will ensure its success and therefore the continued functioning of our business through all future uncertainties.

#### **6.3.4. Government DEFRA and policy makers**

We are an essential public service appointed by statute. It is therefore in the interest of both parties to ensure that we continue to provide our service as a failure to do so would reflect on the government and lead to widespread dissatisfaction among the electorate.

#### **6.3.5. Regulators**

The water industry is heavily regulated, with much of what we do coming under close scrutiny. We need to ensure that we continue to meet our regulatory obligations into the future.

As the effects of climate change become more widespread we predict that we will come under increasing pressure from our regulators to achieve the outputs that are set for us.

Our economic targets set by Ofwat will require sound evidence that we are performing in a sustainable efficient manner whilst the environmental regulators Natural England NE and the Environment Agency EA will expect us to operate in a manner that has the least negative impact on the environment.

Over and above these pressures we will also be required by the Drinking Water Inspectorate (DWI) to produce water to the highest possible standard. It is essential that we work together with the various regulators to achieve all the regulatory outputs required of us, by doing so we will ensure that we maintain our world class service long into the future.

We need to ensure that we maintain open communications with our regulators and encourage our regulators to communicate with one another to guarantee that we are all working together to achieve the same end.

Climate Change Adaptation Plan  
Part 7  
Monitoring and evaluation

## **Part 7 Index**

- 7.1. Monitoring the outcome of the adaptation programme**
  - 7.1.1. Monitoring action plan**
- 7.2. Monitoring and incorporation of climate change threshold into future risk assessment**
- 7.3. Monitoring the residual risks on stakeholders and the organisation**
- 7.4. Ensuring the management of climate change risk is firmly embedded into the organisation**
- 7.5. Ensuring climate change risk management is flexible**
- 7.6. Impacts of this report on climate change management**

## 7. Monitoring the outcome of the adaptation programme

### 7.1. Monitoring the outcomes of the adaptation programme

The Climate Change Adaptation Plan (CCA) is an iterative document. As has been pointed out in section 4 we have now incorporated climate change adaptation into our corporate reporting structures, this will ensure that any climate change related issues are identified and the subsequent adaptation actions are closely monitored.

#### 7.1.1. Monitoring action plan

The following outcomes of this plan will need to be monitored in order to ensure that climate change adaptation becomes embedded in the organisation.

**Table 7.1.1**

| Action   | Responsibility | Mechanism                             | Frequency     |
|--|----------------|---------------------------------------|---------------|
| Monitoring the outcomes of the adaptation programme                                  | Executive      | Climate change adaptation plan review | Yearly        |
| Monitoring and incorporation of climate change threshold into future risk assessment | Regulation     | 5 year Regulatory Business Plan       | Every 5 years |
| Monitoring the residual risks on stakeholders and the organisation                   | Regulation     | 5 year Regulatory Business Plan       | Every 5 years |

### 7.2. Monitoring and incorporation of climate change threshold into future risk assessment

In section 1 we identify approximate future conditions taking into account the impacts of climate change. We also make a comparison with the most extreme conditions we have experienced in the past. This serves to provide an estimation of the thresholds above which the company will encounter difficulty in carrying out its operations.

Future climate change scenarios will be updated when our understanding of these improves. We will continue to monitor these scenarios in our yearly updates of the Climate Change Adaptation Plan and update our estimations of thresholds where necessary.

### **7.3. Monitoring the residual risks on stakeholders and the organisation**

The residual risks include those that remain after the known risks have been dealt with. With better monitoring and data we will be able to quantify risks in a more accurate way thereby reducing residual risks on both stakeholders and the organisation

### **7.4. Ensuring the management of climate change risk is firmly embedded into the organisation**

Embedding climate change risk management into the organisation is a strategic goal. In part 4 of this report we describe this in more detail. In particular part 4. describes how we intend to embed climate change risk into the organisation and table 4.2 gives a breakdown of the processes to which climate change adaptation has been included. Climate change adaptation will be embedded in the in the organisation through

- Raising awareness
- Developing organisational learning
- improving data collection and monitoring
- Changing standards and company policies
- Creating working partnerships with stakeholders

### **7.5. Ensuring climate change risk management is flexible**

By continuously reviewing the risks and assumptions around climate change we intend to identify risks before they become a problem. We view climate change risks in the same light as all risks facing the company. As a result of all strategic risks having regular reviews we can determine if a risk will reach a level where it is unacceptable to the company.

### **7.6. Impacts of this report on climate change management**

Due to the long term planning and resilient management required by our regulators climate change is already taken into account in many key areas of operation. This report serves as a means of ensuring that climate change adaptation is taken into account across all areas of operation, ensuring that we do not overlook any processes that at present are not affected by climatic conditions but could be affected in future.

# Climate Change Adaptation Plan Appendices

## Appendix 1

### Future climate change predictions for South West England

In general terms the climate change predictions as set out in The UK Climate Projections<sup>31</sup> predict that:

- the UK will continue to get warmer
- summers will continue to get hotter and drier for much of the UK
- winters will continue to get milder and wetter
- some weather extremes will become more common, others less common
- sea level will continue to rise.

The following tables give an example of the extent of anticipated change in rainfall and temperature for the 2050's, sea level rise estimates and an estimate of the change in the frequency of extreme weather events for our region. We use these projections to aid our adaptation decision making and assessment of climate related risks.

<sup>31</sup> <http://ukclimateprojections.defra.gov.uk/>

**Table 1: Key findings for South West England, 2050s**<sup>32</sup>

| <i>Medium emissions 2050's</i>        | <i>Central estimate</i> | <i>Change</i> | <i>Most likely range</i> |
|---------------------------------------|-------------------------|---------------|--------------------------|
| Winter mean temperature               | 2.1°C                   | Increase      | 1.1°C to 3.2°C           |
| Summer mean temperature               | 2.7°C                   | Increase      | 1.3°C to 4.6°C           |
| Summer mean daily maximum temperature | 3.8°C                   | Increase      | 1.4°C to 6.8°C           |
| Summer mean daily minimum temperature | 2.9°C                   | Increase      | 1.2°C to 5°C             |
| Annual mean precipitation             | 0%                      | No Change     | –5% to 6%                |
| Winter mean precipitation             | 17%                     | Increase      | 4% to 38%                |
| Summer mean precipitation             | –20%                    | Decrease      | –42% to 7%               |

| <i>Medium emissions 2080's</i>        | <i>Central estimate</i> | <i>Change</i> | <i>Most likely range</i> |
|---------------------------------------|-------------------------|---------------|--------------------------|
| Winter mean temperature               | 2.8°C                   | Increase      | 1.6°C to 4.3°C           |
| Summer mean temperature               | 3.9°C                   | Increase      | 2.1°C to 6.4°C           |
| Summer mean daily maximum temperature | 5.4°C                   | Increase      | 2.2°C to 9.6°C           |
| Summer mean daily minimum temperature | 4.1°C                   | Increase      | 1.9°C to 7.1°C           |
| Annual mean precipitation             | 1%                      | Increase      | –5% to 7%                |
| Winter mean precipitation             | 23%                     | Increase      | 6% to 54%                |
| Summer mean precipitation             | –24%                    | Decrease      | –50% to 6%               |

<sup>32</sup> <http://ukclimateprojections.defra.gov.uk/content/view/2271/528>

**Table 2: Sea level rise and sensitivity ranges for climate change parameters**<sup>33</sup>

| Administrative or Devolved Region | Assumed Vertical Land Movement (mm/yr) | Net sea level rise (mm/yr) | Net sea level rise (mm/yr) | Net sea level rise (mm/yr) | Net sea level rise (mm/yr) |
|-----------------------------------|--|----------------------------|----------------------------|----------------------------|----------------------------|
|                                   |  | 1990-2025                  | 2025-2055                  | 2055-2085                  | 2085-2115                  |
| South West and Wales              | - 0.5                                  | 3.5                        | 8.0                        | 11.5                       | 14.5                       |

**Changes in the frequency of extreme rainfall events over time**<sup>34</sup>

According to the Met Office analysis the uncertainty in the change in summer rainfall is generally larger than that for winter rainfall. The report shows that for most locations, there is no clear indication. Summer rainfall extremes could either increase in frequency or decrease. The greatest uncertainty in summer rainfall is found for locations in the South and South-East which includes the towns/cities Norwich, Cambridge, Ipswich, London, Canterbury, Brighton, Portsmouth, Bournemouth, Southend-on-Sea and Basingstoke.

As is evident from the figures below, the frequency of winter rainfall events December, January, February (DJF) shows a trend of increasing at a greater rate than summer rainfall events June, July, August (JJA).

<sup>33</sup>

<sup>34</sup> Changes in extreme rainfall events for selected towns and cities, A Met Office report for OFWAT July 2010

## Appendix 2

### Summary of all impacts and consequences for a water only company<sup>35</sup>

| ASSET LEVEL 3          | REF | IMPACT TYPE | PRESSURE...  | CONSEQUENCE FOR ASSETS & OPERATIONS                                      | CONSEQUENCE FOR SERVICE                                 |
|------------------------|-----|-------------|--|--|---|
| All Site wide Services | D41 | DROUGHT     | Exfoliation cracks in storage basin affecting coatings/seals, clay liner failure | accelerated asset deterioration  |   |
| All Site wide Services | D42 | DROUGHT     | Relocation of population from drought  | affecting supply-demand balance and other aspects                        |   |
| All Site wide Services | F48 | FLOOD       | Direct asset flooding  | asset loss   | service failure   |
| All Site wide Services | F49 | FLOOD       | Direct asset flooding  | reduced access to assets; H&S risk for site staff                        |   |
| All Site wide Services | F50 | FLOOD       | More frequent storms and power supply flooding,                                  | power outages  | service failure   |
| All Site wide Services | F51 | FLOOD       | Direct flooding of electrical assets,  | risk to staff of electrocution   |   |
| SCADA & Telemetry      | F52 | FLOOD       | Flooding   | loss of SCADA / telemetry  | service failure   |
| All Site wide Services | S27 | SEA LEVEL   | Direct asset flooding  | asset loss   | service failure   |
| All Site wide Services | S28 | SEA LEVEL   | Direct asset flooding  | reduced access to assets, endangering H&S of site staff                  |   |
| All Site wide Services | S29 | SEA LEVEL   | Direct asset flooding, storm damage, coastal erosion or planned retreat          | asset loss   | service failure   |
| All Site wide Services | S30 | SEA LEVEL   | Saline intrusion   | accelerated asset deterioration  |   |
| SCADA & Telemetry      | S31 | SEA LEVEL   | Direct flooding of electrical assets   | higher risk to staff of electrocution                                    |   |
| All Site wide Services | T55 | TEMP. RISE  | Higher levels of UV  | higher risk of sun-related injury and illness                            |   |
| All Site wide Services | T56 | TEMP. RISE  | Higher average and peak temperatures   |  | greater incidence of water & wetland associated disease |
| All Site wide Services | T57 | TEMP. RISE  | Higher average and peak temperatures   | accelerated deterioration of structures, buildings, machinery, equipment |   |
| All Site wide Services | T58 | TEMP. RISE  | Higher temperatures  | increasing vegetation growth at sites                                    |   |
| All Water Networks     | D17 | DROUGHT     | Higher daily & peak demand for garden watering,                                  |  |   |

<sup>35</sup> Water UK A Climate Change Adaptation Approach for Asset Management Planning 41414874 V1.0

|   |       |            |   |   |  |
|---|-------|------------|---|---|--|
| Distribution networks incl. ancillaries | D18   | DROUGHT    | Loss of / intermittent supply   | increased risk of external contaminants entering supply pipelines                                 | contamination of drinking water        |
| Distribution networks incl. ancillaries | D19   | DROUGHT    | Loss of supply and depressurisation of the supply network,                      | more frequent pipe failure  | contamination of drinking water        |
| Distribution networks incl.             | D20   | DROUGHT    | Loss of / intermittent supply   | increases risk of mechanical asset failure (eg in PRVs)   | service failure                        |
| Distribution pumping stations           | D21   | DROUGHT    | Loss of supply and depressurisation of the supply network,                      | more air blockages and service failure  | service failure                        |
| Distribution storage                    | D22   | DROUGHT    | Lower flow rates  | deposition, reducing raw water quality  |  |
| Distribution storage                    | D23   | DROUGHT    | Loss of supply or intermittent supplies   | contamination from accumulated silt and debris being flushed out of service reservoirs and towers | higher drinking water quality risk     |
| All Water Networks                      | F17   | FLOOD      | Direct asset flooding   | asset loss  | service failure                        |
| All Water Networks                      | F17 A | FLOOD      | More frequent storms and power supply flooding,                                 | power outages   | service failure                        |
| Distribution networks incl. ancillaries | F18   | FLOOD      | Flooding  | infiltration into pipelines   | increasing drinking water quality risk |
| Distribution networks incl. ancillaries | F19   | FLOOD      | Direct flooding   | contaminants enter pipelines  | higher drinking water quality risk     |
| Distribution storage                    | F20   | FLOOD      | Direct flooding   | contaminants enter underground storage tanks  | higher drinking water quality risk     |
| All Water Networks                      | G2    | GENERAL    | Relocation of population from weather, flooding, sea level rise                 | affecting supply-demand balance, network capacity etc   |  |
| All Water Networks                      | S11   | SEA LEVEL  | Direct asset flooding, storm damage, coastal erosion or planned retreat         | asset loss  | service failure                        |
| All Water Networks                      | T19   | TEMP. RISE | Higher average and peak temperatures  | accelerated deterioration of structures, buildings, machinery, equipment                          |  |
| Distribution networks incl. ancillaries | T20   | TEMP. RISE | More extreme wetting and drying cycles  | greater soil movement, more pipe movement and bursts  |  |
| Distribution networks incl. ancillaries | T21   | TEMP. RISE | Increased micro-biological growth,  | higher risk of residual chlorine depletion, contamination of supplies                             | higher drinking water quality risk     |
| Distribution storage                    | T22   | TEMP. RISE | Higher peak demand  | leading to greater storage requirements reducing security of supply (??)                          |  |
| Distribution storage                    | T23   | TEMP. RISE | Increased micro-biological growth,  | higher risk of residual chlorine depletion, contamination of supplies                             | higher drinking water quality risk     |
| All Water Resources                     | D1    | DROUGHT    | Reduced available supply  | reduced security of supply  | pressure on water users                |
| All Water Resources                     | D2    | DROUGHT    | Higher daily & peak demand for garden watering,                                 | lower security of supply  | [ ]                                    |
| All Water Resources                     | D3    | DROUGHT    | Intake, borehole pump and reservoir draw-off levels do not match reduced levels |   | service failure                        |
| All Water Resources                     | D4    | DROUGHT    | Lower river & borehole yields or reduced water quality,                         | abstraction licences reduced or removed, reducing security of                                     |  |

|                                     |     |           |   |   |   |
|-------------------------------------|-----|-----------|---|---|---|
|                                     |     |           |   | supply  |   |
| All Water Resources                 | D5  | DROUGHT   | Drier conditions  | security of supply  | increasing customer sensitivity to possibility of service failure, affecting security of supply |
| Storage Reservoirs & Aqueducts      | D6  | DROUGHT   | Lower river flows   | lower yields, increasing demand on existing storage, reducing in security of supply |   |
| Boreholes / source pumping stations | D7  | DROUGHT   | Lower groundwater levels  | reducing borehole yields, reducing security of supply                               |   |
| Raw water pipelines                 | D8  | DROUGHT   | Lower flow rates  | deposition; reduced raw water quality   |   |
| Intake Pumping stations             | D9  | DROUGHT   | River levels fall,  | reduced reliability as water sources, reducing security of supply                   |   |
| All Water Resources                 | F1  | FLOOD     | Direct asset flooding   | asset loss  | service failure   |
| Intake Pumping stations             | F10 | FLOOD     | More storm water,   | increased pump usage & accelerated asset deterioration                              |   |
| All Water Resources                 | F2  | FLOOD     | More frequent storms and power supply flooding,   | power outages   | service failure   |
| All Water Resources                 | F3  | FLOOD     | Movement of permanent population (eg away from flood plains) and tourism due to flooding,   |   | impacts on demand and security of supply  |
| All Water Resources                 | F4  | FLOOD     | The threat of assets being flooded  |   | higher customer expectations for visible hard engineering adaptation solutions                  |
| Storage Reservoirs & Aqueducts      | F5  | FLOOD     | Increased soil erosion  | siltation of dams, accelerating asset deterioration                                 |   |
| Storage Reservoirs & Aqueducts      | F6  | FLOOD     | More intense rainfall events & changes to soil conditions                                   | slippage of soil dams, asset loss   | service failure, customer flooding  |
| Storage Reservoirs & Aqueducts      | F7  | FLOOD     | More intense rainfall events  | overwhelming spillways, asset loss  | service failure, customer flooding  |
| Boreholes / source pumping stations | F8  | FLOOD     | More intense rainfall compacting upper soil layers,   | more run-off, less recharge of aquifers, lower security of supply                   |   |
| Raw water pipelines                 | F9  | FLOOD     | Flooding  | infiltration into pipelines   | increasing drinking water quality risk  |
| All Water Resources                 | S1  | SEA LEVEL | Direct asset flooding, storm damage, coastal erosion or planned retreat                     | asset loss  | service failure   |
| All Water Resources                 | S2  | SEA LEVEL | Saline intrusion  | accelerated asset deterioration   | [ ]   |
| All Water Resources                 | S3  | SEA LEVEL | Movement of permanent population (e.g. away from flood plains) and tourism due to flooding, |   | impacts on demand and security of supply  |
| Boreholes / source pumping stations | S4  | SEA LEVEL | Saline intrusion  | decreasing yields, causing reduction in security of supply                          | service failure   |

|                                     |     |            |  |  |  |
|-------------------------------------|-----|------------|--|--|--|
| Intake Pumping stations             | S5  | SEA LEVEL  | Tidal limits moving upstream and increasing salinity at intakes, | raw water resource loss and reduced security of supply   |  |
| All Water Resources                 | T1  | TEMP. RISE | Higher average and peak temperatures                             | accelerated deterioration of structures, buildings, machinery, equipment                               |  |
| All Water Resources                 | T2  | TEMP. RISE | Redistribution of / increase in tourism                          | reduced security of supply   | increased seasonal demand,                                   |
| All Water Resources                 | T3  | TEMP. RISE | Higher daily and peak domestic and commercial demand,            | reduced security of supply   |  |
| All Water Resources                 | T4  | TEMP. RISE | Higher temperatures and longer growing season                    | redistribution of / increase in agricultural demand and impacts on security of supply                  |  |
| All Water Resources                 | T5  | TEMP. RISE | Redistribution of permanent population with warmer conditions,   |  | impacts on demand and security of supply                     |
| All Water Resources                 | T6  | TEMP. RISE | Higher temperatures  | security of supply   | increasing customer sensitivity affecting security of supply |
| Storage Reservoirs & Aqueducts      | T7  | TEMP. RISE | Increased evapotranspiration,                                    | lower infiltration and borehole yields, reducing security of supply                                    |  |
| Storage Reservoirs & Aqueducts      | T8  | TEMP. RISE | Increased evapotranspiration                                     | lower surface reservoirs yields; greater reliance on groundwater recharge, reducing security of supply |  |
| Boreholes / source pumping stations | T9  | TEMP. RISE | Increased evapotranspiration,                                    | lower infiltration and borehole yields, reducing security of supply                                    |  |
| All Water Treatment                 | D10 | DROUGHT    | Low flows  | lead to greater sedimentation & blockages  | service failure  |
| Treatment works                     | D11 | DROUGHT    | Reduced raw water volumes reducing dilution                      |  | increase drinking water quality risk                         |
| Service Reservoirs & Water Towers   | D12 | DROUGHT    | Intermittency in supply  | silt and debris accumulating in service reservoirs and towers  | higher drinking water quality risk                           |
| Service Reservoirs & Water Towers   | D13 | DROUGHT    | Loss of / intermittent supply                                    | increases risk of external contaminants entering supply pipelines                                      |  |
| Service Reservoirs & Water Towers   | D14 | DROUGHT    | Loss of supply and de-pressurisation                             | more frequent pipe failure   | contamination of drinking water                              |
| Service Reservoirs & Water Towers   | D15 | DROUGHT    | Inversions occur more frequently with low water levels;          | Cryptosporidium accumulation   | higher drinking water quality risk                           |
| Treated water pumping stations      | D16 | DROUGHT    | Loss of supply and depressurisation of the supply network,       | more air blockages   | service failure  |
| All Water Treatment                 | F11 | FLOOD      | Direct asset flooding  | asset loss   | service failure  |
| All Water Treatment                 | F12 | FLOOD      | More frequent storms and power supply flooding,                  | power outages  | service failure  |
| Treatment works                     | F13 | FLOOD      | More intense rainfall events                                     |  | discolouration and odour problems for drinking water         |

|                                   |     |            |   |  |  |
|-----------------------------------|-----|------------|---|--|--|
|                                   |     |            |   |  | (through biological consequences)  |
| Treatment works                   | F14 | FLOOD      | Increased runoff  | higher sediment levels   | higher drinking water quality risk   |
| Service Reservoirs & Water Towers | F15 | FLOOD      | Direct flooding   | contaminants enter underground storage tanks                             | higher drinking water quality risk   |
| Service Reservoirs & Water Towers | F16 | FLOOD      | Direct flooding   | contaminants enter pipelines   | higher drinking water quality risk   |
| All Water Treatment               | G1  | GENERAL    | Relocation of population from weather, flooding, sea level rise         | affecting supply-demand balance, treatment works, asset capacity etc     |  |
| Treatment works                   | S10 | SEA LEVEL  | Tidal limits moving upstream and increasing salinity at intakes,        | raw water resource loss and reduced security of supply                   |  |
| All Water Treatment               | S6  | SEA LEVEL  | Direct asset flooding, storm damage, coastal erosion or planned retreat | asset loss   | service failure  |
| All Water Treatment               | S7  | SEA LEVEL  | Saline intrusion in groundwater   | accelerated asset deterioration  | [ ]  |
| All Water Treatment               | S8  | SEA LEVEL  | Sea level rise  | increases frequency of power loss  | service failure  |
| Treatment works                   | S9  | SEA LEVEL  | Saline intrusion  | decreasing yields, causing reduction in security of supply               | service failure  |
| All Water Treatment               | T10 | TEMP. RISE | Higher temperatures   | more algal growth and micro-organisms in the water supply system         | higher drinking water quality risk   |
| All Water Treatment               | T11 | TEMP. RISE | Higher average and peak temperatures                                    | accelerated deterioration of structures, buildings, machinery, equipment |  |
| Treatment works                   | T12 | TEMP. RISE | Higher temperatures   | lower raw water quality  | greater risk to drinking water quality   |
| Treatment works                   | T13 | TEMP. RISE | Higher temperatures   | impacts on treatment process   | improving treated water quality  |
| Treatment works                   | T14 | TEMP. RISE | More frequent disease increasing drinking water quality risk            | additional potable water standards                                       |  |
| Treatment works                   | T15 | TEMP. RISE | Higher temperatures   |  | discolouration and odour problems for drinking water (through biological consequences) |
| Service Reservoirs & Water Towers | T16 | TEMP. RISE | Increased micro-biological growth,                                      | higher risk of residual chlorine depletion, contamination of supplies    | higher drinking water quality risk   |
| Service Reservoirs & Water Towers | T17 | TEMP. RISE | Increased micro-biological growth,                                      | higher risk of residual chlorine depletion, contamination of supplies    | higher drinking water quality risk   |
| Service Reservoirs & Water Towers | T18 | TEMP. RISE | More extreme wetting and drying cycles                                  | greater soil movement, more pipe movement and bursts                     |  |

## Appendix 3

### Summary of the highest scoring strategic climate change impacts faced by the company and associated risks for UKCIP planning horizons 2020's, 2050's and 2080's

Table 3.1 2020's Short term risk

| ASSET AFFECTED         |        | Droughts (lower rainfall)  | Info Source Ref              |            |                      |       |
|------------------------|--------|--|------------------------------|------------|----------------------|-------|
|                        | Impact | All Drought Impacts<br><b>105, 106, 108, 209, 213, 223, 303, 314, 404, 410, 412, 414</b>   |                              | Likelihood | Level of consequence | Score |
| All Water Resources    | D2     | Daily & peak demand for 'garden' watering increases, causing a <b>reduction in security of supply</b><br>Lower river yields, borehole yields or reduced water quality lead to abstraction licences being reduced or removed, causing a <b>reduction in security of supply</b>                            | 117, 401, 224, 405, 416, 417 | 2          | 5                    | 10    |
|                        | D4     |  |                              | 2          | 5                    | 10    |
| ASSET AFFECTED         |        | Temperature rise   | Info Source Ref              |            |                      |       |
|                        | Impact | All Temperature Rise Impacts<br><b>303, 314, 404, 410, 412, 414</b>  |                              | Likelihood | Level of consequence | Score |
| All Water Treatment    | T10    | Increased algal growth and risk of microscopic organisms within the water supply system <b>increases drinking water quality risk</b>   | 318                          | 3          | 3                    | 9     |
|                        | T11    | Higher average and peak temperatures affect structures, buildings, H & V, MEICA plant working life, causing <b>accelerated asset deterioration</b><br>Higher average and peak temperatures affect structures, buildings, H & V, MEICA plant working life, <b>causing accelerated asset deterioration</b> |                              | 2          | 4                    | 8     |
| All Water Networks     | T19    |  | 318                          | 2          | 4                    | 8     |
| ASSET AFFECTED         |        | Flooding   | Info Source Ref              |            |                      |       |
|                        |        | <b>104, 205, 206, 207, 303, 314, 402, 404, 410, 412, 414</b>   |                              | Likelihood | Level of consequence |       |
| All Water Networks     | F17    | Direct asset flooding causes <b>service failure and asset loss</b>   | 201, 215, 304, 406           | 2          | 5                    | 10    |
| All Site wide Services | F51    | Direct flooding leads to submersion of electrical assets, increasing risk to operatives of electrocution <b>endangering H&amp;S of site staff</b>  |                              | 2          | 5                    | 10    |

Table 3.2 2050's Medium term risk

| ASSET AFFECTED   |     |   | Droughts (lower rainfall)                                  |            | Info Source Ref      |       |  |
|--|-----|---|--|------------|----------------------|-------|--|
| Impact   |     |   | 105, 106, 108, 209, 213, 223, 303, 314, 404, 410, 412, 414 | Likelihood | Level of consequence | Score |  |
| All Water Resources                                      | D2  | Daily & peak demand for 'garden' watering increases, causing a reduction in security of supply  | 117, 401   | 2          | 5                    | 10    |  |
|  | D4  | Lower river yields, borehole yields or reduced water quality lead to abstraction licences being reduced or removed, causing a reduction in security of supply | 224, 405, 416, 417   | 2          | 5                    | 10    |  |
| Storage Reservoirs and Aqueducts Intake Pumping stations | D6  | Lower river flows reduce yields and hence increased demand on existing storage, and causes a reduction in security of supply                                  | 224, 405, 416, 417   | 3          | 3                    | 9     |  |
|  | D9  | River levels fall and they become less reliable sources, reducing security of supply  | 224, 405, 416, 417   | 3          | 3                    | 9     |  |
| ASSET AFFECTED   |     |   | Temperature rise   |            | Info Source Ref      |       |  |
|  |     |   |  | Likelihood | Level of consequence | Score |  |
| All Water Treatment                                      | T10 | Increased algal growth and risk of microscopic organisms within the water supply system increases drinking water quality risk                                 | 318  | 4          | 3                    | 12    |  |
|  | T11 | Higher average and peak temperatures affect structures, buildings, H & V, MEICA plant working life, causing accelerated asset deterioration                   |  | 3          | 4                    | 12    |  |
| Treatment works  | T12 | Higher temperatures reduce raw water quality and increase drinking water quality risk   | 318  | 3          | 3                    | 9     |  |
| Distribution networks including ancillaries              | T20 | Greater extremities in wetting and drying cycles lead to greater soil movement, causing pipe systems to move increasing burst frequency                       | 304  | 3          | 3                    | 9     |  |
|  | T57 | Higher average and peak temperatures affect structures, buildings, H & V, MEICA plant working life, causing accelerated asset deterioration                   |  | 3          | 3                    | 9     |  |
| ASSET AFFECTED   |     |   | Floods (higher rainfall)                                   |            | Info Source Ref      |       |  |
| Water Resources - All                                    |     |   | All Flood Impacts  |            |                      |       |  |
