Ithaca Energy (UK) Limited

Consents given under the Petroleum Act 1998 and Reviews under the Assessment of Environmental Effects Regulations 1999

The Jacky development is located in Block 12/21c approximately 19 kilometres to the east of the Moray Firth East Caithness cliffs and 10km northwest of the Beatrice Alpha complex in Block 11/30. The development will initially consist of one production well and the Jacky platform will consist of a small, unmanned, removable platform. Two pipelines will be installed to connect the Jacky platform to the Beatrice Alpha platform. The pipelines will be trenched and buried and it is likely that rock dumping material will be required. All Jacky produced fluids will be exported to the Beatrice Alpha platform. Peak oil production is expected to be in the region of 10,000 bopd. Jacky gas will be produced to the Beatrice Alpha platform.

The proposed Jacky platform is 39km from the Moray Firth SAC and 19km from the East Caithness Cliffs SPA. The Jacky Field Development Rev 01 environmental statement (ES) (D/3768/2208) was approved by BERR on 31 July 2008.
