

Weekly rainfall and river flow summary

Weekly bulletin: Wednesday 31 August to Tuesday 6 September 2016

Summary: Slightly wetter than last week in southern England but slightly drier elsewhere. River flows are mainly normal for the time of year.

Rainfall

The past week has seen rainfall typical for the time of year; the east of the country has been slightly drier than the west. Rainfall totals range from 9 mm in east England to 25 mm in south-west England (Table 1 and Figure 1). Cumulative rainfall totals for September to date, range from 17% of the long term average (LTA) in east England, to 30% in south-west England (Table 1).

River flow

River flows have increased at nearly two thirds of our indicator sites in England compared to the previous week. The latest daily mean river flows are [normal](#) or higher for the time of year at all but 1 indicator site (Figure 2).

Outlook

After a dry start rain is expected to move in from the west on Friday. A mix of sunshine and showers (heavy in places) will then continue across the country through the weekend and into Monday and Tuesday.

Table 1: Latest rainfall summary information (Source: Met Office © Crown Copyright, 2016)¹

¹ Notes:

- LTA = long term average rainfall for 1961 – 1990.
- Data for the current month are calculated using MORECS (Met Office Rainfall and Evaporation Calculation System); data for past months are provisional values from the National Climate Information Centre (NCIC).
- The data is rounded to the nearest millimetre or percent (except when values are less than 1).
- Recorded amounts of rainfall are likely to be underestimated during snow events.

All data are provisional and may be subject to revision. The views expressed in this document are not necessarily those of the Environment Agency. Its officers, servants or agents accept no liability for any loss or damage arising from the interpretation or use of the information, or reliance upon views contained herein.

River flow

[^] 'Naturalised' flows are provided for the Thames at Kingston and the Lee at Feildes Weir.

Figure 2: Latest daily mean river flow, relative to an analysis of historic daily mean flows, classed by flow percentile for the same time of year² (Source: Environment Agency). Crown copyright. All rights reserved. Environment Agency, 100026380, 2016.

²Flow percentiles describe the percentage of time that a particular flow has been equalled or exceeded compared to the historic flow record for that site for the time of year. Flow percentiles presented relate to an analysis for the time of year and not a whole year.

River flow categories

Exceptionally high	Value likely to fall within this band 5% of the time
Notably high	Value likely to fall within this band 8% of the time
Above normal	Value likely to fall within this band 15% of the time
Normal	Value likely to fall within this band 44% of the time
Below normal	Value likely to fall within this band 15% of the time
Notably low	Value likely to fall within this band 8% of the time
Exceptionally low	Value likely to fall within this band 5% of the time
