BS EN 62676-2-3 – Video surveillance systems for use in security applications, Part 2-3: System requirements – Video transmission protocols – IP interoperability implementation based on Web services

This standard sets out procedures for communication between servers and video transmission devices, such as cameras, based on using web based services.

It makes it possible to use devices and receivers from different manufacturers to build a system. There are management and control interfaces set out in the standard which are described as 'web services' and it contains definitions for the code/language devices should use to communicate.

It also enables video manufacturers to offer standardised equipment to their customers.
