

Early Access to Medicines Scheme – Treatment protocol – Information for healthcare professionals

Introduction

The aim of the Early Access to Medicines Scheme (EAMS) is to provide earlier availability of promising new unlicensed and 'off label' medicines to UK patients that have a high unmet clinical need. The medicinal products included in the scheme are those that are intended to treat, diagnose or prevent seriously debilitating or life threatening conditions where there are no adequate treatment options. More information about the scheme can be found

here: <http://www.mhra.gov.uk/Howweregulate/Innovation/EarlyaccesstomedicinesschemeEAMS/index.htm>

This information is intended for healthcare professionals and is provided by the pharmaceutical company that manufactures the medicine. This medicine does not yet have a licence (marketing authorisation) in this indication and the information is provided to assist the doctor in prescribing an unlicensed medicine. Guidance on prescribing unlicensed medicines can be found on the GMC webpage:

<http://www.gmc-uk.org/mobile/14327>

The scientific opinion is based on the information supplied to the MHRA on the benefits and risks of a promising new medicine. As such this is a scientific opinion and should not be regarded as a medicine licensed by the MHRA or a future commitment by the MHRA to license such a medicine.

The prescribing doctor should also refer to the summary information on the pharmacovigilance system which is provided in the document 'Early Access to Medicines Scheme – Treatment protocol – Information on the pharmacovigilance system'.

Information for the healthcare professionals:

1. NAME OF THE MEDICINAL PRODUCT

Nivolumab 10 mg/mL concentrate for solution for infusion.

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each mL of concentrate contains 10 mg of nivolumab.
One vial of 10 mL contains 100 mg of nivolumab.

Nivolumab is produced in Chinese hamster ovary cells by recombinant DNA technology.

Excipient with known effect

Each mL of concentrate contains 0.1 mmol (or 2.5 mg) sodium.

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Concentrate for solution for infusion (sterile concentrate).

Clear to opalescent, colourless to pale yellow liquid that may contain few light particles. The solution has a pH of approximately 6.0 and an osmolality of approximately 340 mOsm/kg.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Nivolumab as monotherapy is indicated for the treatment of adult patients with advanced renal cell carcinoma after prior therapy.

4.2 Posology and method of administration

Treatment must be initiated and supervised by physicians experienced in the treatment of cancer.

Posology

The recommended dose of nivolumab is 3 mg/kg administered intravenously over 60 minutes every 2 weeks. Treatment should be continued as long as clinical benefit is observed or until treatment is no longer tolerated by the patient.

Dose escalation or reduction is not recommended. Dosing delay or discontinuation may be required based on individual safety and tolerability. Guidelines for permanent discontinuation or withholding of doses are described in Table 1. Detailed guidelines for the management of immune-related adverse reactions are described in section 4.4.

Table 1: Recommended treatment modifications for Nivolumab		
Immune-related adverse reaction	Severity	Treatment modification
Immune-related pneumonitis	Grade 2 pneumonitis	Withhold Nivolumab until symptoms resolve, radiographic abnormalities improve, and management with corticosteroids is complete
	Grade 3 or 4 pneumonitis	Permanently discontinue Nivolumab
Immune-related colitis	Grade 2 or 3 diarrhoea or colitis	Withhold Nivolumab until symptoms resolve and management with corticosteroids, if needed, is complete
	Grade 4 diarrhoea or colitis	Permanently discontinue Nivolumab
Immune-related hepatitis	Grade 2 elevation in aspartate aminotransferase (AST), alanine aminotransferase (ALT), or total bilirubin	Withhold Nivolumab until laboratory values return to baseline and management with corticosteroids, if needed, is complete
	Grade 3 or 4 elevation in AST, ALT, or total bilirubin	Permanently discontinue Nivolumab
Immune-related nephritis and renal dysfunction	Grade 2 or 3 creatinine elevation	Withhold Nivolumab until creatinine returns to baseline and management with corticosteroids is complete
	Grade 4 creatinine elevation	Permanently discontinue Nivolumab
Immune-related endocrinopathies	Symptomatic Grade 2 or 3 hypothyroidism, hyperthyroidism, hypophysitis Grade 2 adrenal insufficiency Grade 3 diabetes	Withhold Nivolumab until symptoms resolve and management with corticosteroids (if needed for symptoms of acute inflammation) is complete. Nivolumab should be continued in the presence of hormone replacement therapy ^a as long as no symptoms are present
	Grade 4 hypothyroidism Grade 4 hyperthyroidism Grade 4 hypophysitis Grade 3 or 4 adrenal insufficiency Grade 4 diabetes	Permanently discontinue Nivolumab
Immune-related rash	Grade 3 rash	Withhold dose until symptoms resolve and management with corticosteroids is complete
	Grade 4 rash	Permanently discontinue Nivolumab

Note: Toxicity grades are in accordance with National Cancer Institute Common Terminology Criteria for Adverse Events Version 4.0 (NCI-CTCAE v4).

^a Recommendation for the use of hormone replacement therapy is provided in section 4.4.

Patients treated with Nivolumab must be given the patient alert card and be informed about the risks of Nivolumab.

Nivolumab should also be permanently discontinued for Grade 2 or 3 immune-related adverse reactions that persist despite treatment modifications (see section 4.4) or for inability to reduce corticosteroid dose to 10 mg prednisone or equivalent per day.

Special populations

Paediatric population

The safety and efficacy of Nivolumab in children below 18 years of age have not been established. No data are available.

Elderly

No dose adjustment is required for elderly patients (≥ 65 years) (see sections 5.1 and 5.2).

Renal impairment

Based on the population pharmacokinetic (PK) results, no dose adjustment is required in patients with mild or moderate renal impairment (see section 5.2). Data from patients with severe renal impairment are too limited to draw conclusions on this population.

Hepatic impairment

Based on the population PK results, no dose adjustment is required in patients with mild hepatic impairment (see section 5.2). Data from patients with moderate or severe hepatic impairment are too limited to draw conclusions on these populations. Nivolumab must be administered with caution in patients with moderate (total bilirubin $> 1.5 \times$ to $3 \times$ the upper limit of normal [ULN] and any AST) or severe (total bilirubin $> 3 \times$ ULN and any AST) hepatic impairment.

Method of administration

Nivolumab is for intravenous use only. It is to be administered as an intravenous infusion over a period of 60 minutes. The infusion must be administered through a sterile, non-pyrogenic, low protein binding in-line filter with a pore size of 0.2-1.2 μm .

Nivolumab must not be administered as an intravenous push or bolus injection.

The total dose of nivolumab required can be infused directly as a 10 mg/mL solution or can be diluted to as low as 1 mg/mL with sodium chloride 9 mg/mL (0.9%) solution for injection or glucose 50 mg/mL (5%) solution for injection.

For instructions on the handling of the medicinal product before administration, see section 6.6.

4.3 Contraindications

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

4.4 Special warnings and precautions for use

Nivolumab is associated with immune-related adverse reactions. Patients should be monitored continuously (at least up to 5 months after the last dose) as an adverse reaction with nivolumab may occur at any time during or after discontinuation of nivolumab therapy.

For suspected immune-related adverse reactions, adequate evaluation should be performed to confirm aetiology or exclude other causes. Based on the severity of the adverse reaction, nivolumab should be withheld and corticosteroids administered. If immunosuppression with corticosteroids is used to treat an adverse reaction, a taper of at least 1 month duration should be initiated upon improvement. Rapid tapering may lead to worsening or recurrence of the adverse reaction. Non-corticosteroid immunosuppressive therapy should be added if there is worsening or no improvement despite corticosteroid use.

Nivolumab should not be resumed while the patient is receiving immunosuppressive doses of corticosteroids or other immunosuppressive therapy. Prophylactic antibiotics should be used to prevent

opportunistic infections in patients receiving immunosuppressive therapy.

Nivolumab must be permanently discontinued for any severe immune-related adverse reaction that recurs and for any life threatening immune-related adverse reaction.

Immune-related pneumonitis

Severe pneumonitis or interstitial lung disease, including fatal cases, has been observed with nivolumab treatment (see section 4.8). Patients should be monitored for signs and symptoms of pneumonitis such as radiographic changes (e.g., focal ground glass opacities, patchy infiltrates), dyspnoea, and hypoxia. Infectious and disease-related aetiologies should be ruled out.

For Grade 3 or 4 pneumonitis, nivolumab must be permanently discontinued, and corticosteroids should be initiated at a dose of 2 to 4 mg/kg/day methylprednisolone equivalents.

For Grade 2 (symptomatic) pneumonitis, nivolumab should be withheld and corticosteroids initiated at a dose of 1 mg/kg/day methylprednisolone equivalents. Upon improvement, nivolumab may be resumed after corticosteroid taper. If worsening or no improvement occurs despite initiation of corticosteroids, corticosteroid dose should be increased to 2 to 4 mg/kg/day methylprednisolone equivalents and nivolumab must be permanently discontinued.

Immune-related colitis

Severe diarrhoea or colitis has been observed with nivolumab treatment (see section 4.8). Patients should be monitored for diarrhoea and additional symptoms of colitis, such as abdominal pain and mucus or blood in stool. Infectious and disease-related aetiologies should be ruled out.

For Grade 4 diarrhoea or colitis, nivolumab must be permanently discontinued, and corticosteroids should be initiated at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents.

For Grade 3 diarrhoea or colitis, nivolumab should be withheld and corticosteroids initiated at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents. Upon improvement, nivolumab may be resumed after corticosteroid taper. If worsening or no improvement occurs despite initiation of corticosteroids, nivolumab must be permanently discontinued.

For Grade 2 diarrhoea or colitis, nivolumab should be withheld. Persistent diarrhoea or colitis should be managed with corticosteroids at a dose of 0.5 to 1 mg/kg/day methylprednisolone equivalents. Upon improvement, nivolumab may be resumed after corticosteroid taper, if needed. If worsening or no improvement occurs despite initiation of corticosteroids, corticosteroid dose should be increased to 1 to 2 mg/kg/day methylprednisolone equivalents and nivolumab must be permanently discontinued.

Immune-related hepatitis

Severe hepatitis has been observed with nivolumab treatment (see section 4.8). Patients should be monitored for signs and symptoms of hepatitis such as transaminase and total bilirubin elevations. Infectious and disease-related aetiologies should be ruled out.

For Grade 3 or 4 transaminase or total bilirubin elevation, nivolumab must be permanently discontinued, and corticosteroids should be initiated at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents.

For Grade 2 transaminase or total bilirubin elevation, nivolumab should be withheld. Persistent elevations in these laboratory values should be managed with corticosteroids at a dose of 0.5 to 1 mg/kg/day methylprednisolone equivalents. Upon improvement, nivolumab may be resumed after corticosteroid taper, if needed. If worsening or no improvement occurs despite initiation of corticosteroids, corticosteroid dose should be increased to 1 to 2 mg/kg/day methylprednisolone equivalents and nivolumab must be permanently discontinued.

Immune-related nephritis or renal dysfunction

Severe nephritis or renal dysfunction has been observed with nivolumab treatment (see section 4.8). Patients should be monitored for signs and symptoms of nephritis and renal dysfunction. Most patients present with asymptomatic increases in serum creatinine. Disease-related aetiologies should be ruled out.

For Grade 4 serum creatinine elevation, nivolumab must be permanently discontinued, and corticosteroids should be initiated at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents.

For Grade 2 or 3 serum creatinine elevation, nivolumab should be withheld, and corticosteroids should be initiated at a dose of 0.5 to 1 mg/kg/day methylprednisolone equivalents. Upon improvement, nivolumab may be resumed after corticosteroid taper. If worsening or no improvement occurs despite initiation of corticosteroids, corticosteroid dose should be increased to 1 to 2 mg/kg/day methylprednisolone equivalents, and nivolumab must be permanently discontinued.

Immune-related endocrinopathies

Severe endocrinopathies, including hypothyroidism, hyperthyroidism, adrenal insufficiency, hypophysitis, diabetes mellitus, and diabetic ketoacidosis have been observed with nivolumab treatment (see section 4.8).

Patients should be monitored for clinical signs and symptoms of endocrinopathies and for changes in thyroid function (at the start of treatment, periodically during treatment, and as indicated based on clinical evaluation). Patients may present with fatigue, headache, mental status changes, abdominal pain, unusual bowel habits, and hypotension, or nonspecific symptoms which may resemble other causes such as brain metastasis or underlying disease. Unless an alternate etiology has been identified, signs or symptoms of endocrinopathies should be considered immune-related.

For symptomatic hypothyroidism, nivolumab should be withheld, and thyroid hormone replacement should be initiated as needed. For symptomatic hyperthyroidism, nivolumab should be withheld and methimazole should be initiated as needed. Corticosteroids at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents should also be considered if acute inflammation of the thyroid is suspected. Upon improvement, nivolumab may be resumed after corticosteroid taper, if needed. Monitoring of thyroid function should continue to ensure appropriate hormone replacement is utilised. Nivolumab must be permanently discontinued for life-threatening hyperthyroidism or hypothyroidism.

For symptomatic Grade 2 adrenal insufficiency, nivolumab should be withheld, and physiologic corticosteroid replacement should be initiated as needed. Nivolumab must be permanently discontinued for severe (Grade 3) or life-threatening (Grade 4) adrenal insufficiency. Monitoring of adrenal function and hormone levels should continue to ensure appropriate corticosteroid replacement is utilised.

For symptomatic Grade 2 or 3 hypophysitis, nivolumab should be withheld, and hormone replacement should be initiated as needed. Corticosteroids at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents should also be considered if acute inflammation of the pituitary gland is suspected. Upon improvement, nivolumab may be resumed after corticosteroid taper, if needed. Nivolumab must be permanently discontinued for life-threatening (Grade 4) hypophysitis. Monitoring of pituitary function and hormone levels should continue to ensure appropriate hormone replacement is utilised.

For symptomatic diabetes, nivolumab should be withheld, and insulin replacement should be initiated as needed. Monitoring of blood sugar should continue to ensure appropriate insulin replacement is utilised. Nivolumab must be permanently discontinued for life-threatening diabetes.

Immune-related rash

Severe rash has been observed with nivolumab treatment that may be immune-related (see section 4.8). Nivolumab should be withheld for Grade 3 rash and discontinued for Grade 4 rash. Severe rash should be managed with high-dose corticosteroid at a dose of 1 to 2 mg/kg/day methylprednisolone equivalents. Rare cases of toxic epidermal necrolysis (TEN) some of them with fatal outcome have been observed. If symptoms or signs of Stevens-Johnson Syndrome (SJS) or TEN appear, nivolumab treatment should be

discontinued and the patient referred to a specialised unit for assessment and treatment. If the patient has developed SJS or TEN with the use of nivolumab, permanent discontinuation of nivolumab is recommended.

Caution should be used when considering the use of nivolumab in a patient who has previously experienced a severe or life-threatening skin adverse reaction on prior treatment with other immunostimulatory anticancer agents.

Other immune-related adverse reactions

The following immune-related adverse reactions were reported in less than 1% of patients treated with nivolumab in clinical trials across doses and tumour types: pancreatitis, uveitis, demyelination, autoimmune neuropathy (including facial and abducens nerve paresis), Guillain-Barré syndrome, hypopituitarism, and myasthenic syndrome.

For suspected immune-related adverse reactions, adequate evaluation should be performed to confirm aetiology or exclude other causes. Based on the severity of the adverse reaction, nivolumab should be withheld and corticosteroids administered. Upon improvement, nivolumab may be resumed after corticosteroid taper. Nivolumab must be permanently discontinued for any severe immune-related adverse reaction that recurs and for any life-threatening immune-related adverse reaction.

Infusion reactions

Severe infusion reactions have been reported in clinical trials (see section 4.8). In case of a severe or life-threatening infusion reaction, nivolumab infusion must be discontinued and appropriate medical therapy administered. Patients with mild or moderate infusion reaction may receive nivolumab with close monitoring and use of premedication according to local treatment guidelines for prophylaxis of infusion reactions.

Special populations

Patients with a baseline Karnofsky performance score < 70%, any history of or concurrent brain metastases, active autoimmune disease, or medical conditions requiring systemic immunosuppression were excluded from the pivotal trial in renal cell carcinoma (RCC) (see sections 4.5 and 5.1). In the absence of data, nivolumab should be used with caution in these populations after careful consideration of the potential risk-benefit on an individual basis.

Patients on controlled sodium diet

Each mL of this medicinal product contains 0.1 mmol (or 2.5 mg) sodium. To be taken into consideration when treating patients on a controlled sodium diet.

Patient Alert Card

All prescribers of Nivolumab must be familiar with the Physician Information and Management Guidelines provided in the Physician Pack. The prescriber must discuss the risks of Nivolumab therapy with the patient and provide a Patient Alert Card to each patient prior to starting treatment.

4.5 Interaction with other medicinal products and other forms of interaction

Nivolumab is a human monoclonal antibody, as such pharmacokinetic interaction studies have not been conducted. As monoclonal antibodies are not metabolised by cytochrome P450 (CYP) enzymes or other drug metabolising enzymes, inhibition or induction of these enzymes by co-administered medicinal products is not anticipated to affect the pharmacokinetics of nivolumab.

Other forms of interaction

Systemic immunosuppression

The use of systemic corticosteroids and other immunosuppressants at baseline, before starting nivolumab, should be avoided because of their potential interference with the pharmacodynamic activity. However, systemic corticosteroids and other immunosuppressants can be used after starting nivolumab to

treat immune-related adverse reactions. The preliminary results show that systemic immunosuppression after starting nivolumab treatment does not appear to preclude the response on nivolumab.

4.6 Fertility, pregnancy and lactation

Pregnancy

There are no data on the use of nivolumab in pregnant women. Studies in animals have shown embryofetal toxicity (see section 5.3). Human IgG4 is known to cross the placental barrier and nivolumab is an IgG4; therefore, nivolumab has the potential to be transmitted from the mother to the developing fetus. Nivolumab is not recommended during pregnancy and in women of childbearing potential not using effective contraception unless the clinical benefit outweighs the potential risk. Effective contraception should be used for at least 5 months following the last dose of nivolumab.

Breast-feeding

It is unknown whether nivolumab is secreted in human milk. Because many medicinal products, including antibodies, can be secreted in human milk, a risk to the newborns/infants cannot be excluded. A decision must be made whether to discontinue breast-feeding or to discontinue from nivolumab therapy taking into account the benefit of breast-feeding for the child and the benefit of therapy for the woman.

Fertility

Studies to evaluate the effect of nivolumab on fertility have not been performed. Thus, the effect of nivolumab on male and female fertility is unknown.

4.7 Effects on ability to drive and use machines

Based on its pharmacodynamic properties, nivolumab is unlikely to affect the ability to drive and use machines. Because of potential adverse reactions such as fatigue (see section 4.8), patients should be advised to use caution when driving or operating machinery until they are certain that nivolumab does not adversely affect them.

4.8 Undesirable effects

Summary of the safety profile

Nivolumab is most commonly associated with immune-related adverse reactions. Most of these, including severe reactions, resolved following initiation of appropriate medical therapy or withdrawal of nivolumab (see “Description of selected adverse reactions” below).

In the pooled dataset of patients treated with nivolumab 3 mg/kg as monotherapy across tumour types, the most frequent adverse reactions ($\geq 10\%$) were fatigue (34%), rash (19%), pruritus (14%), diarrhoea (13%), nausea (13%), and decreased appetite (10%). The majority of adverse reactions were mild to moderate (Grade 1 or 2).

Tabulated summary of adverse reactions

Adverse reactions reported in the pooled dataset of patients treated with nivolumab 3 mg/kg monotherapy (n=1728) are presented in Table 2. These reactions are presented by system organ class and by frequency. Frequencies are defined as: very common ($\geq 1/10$); common ($\geq 1/100$ to $< 1/10$); uncommon ($\geq 1/1,000$ to $< 1/100$); rare ($\geq 1/10,000$ to $< 1/1,000$); very rare ($< 1/10,000$). Within each frequency grouping, adverse reactions are presented in the order of decreasing seriousness.

Table 2: Adverse reactions with nivolumab 3 mg/kg monotherapy

Infections and infestations	
Common	upper respiratory tract infection
Uncommon	pneumonia ^a , bronchitis

Neoplasms benign, malignant and unspecified (including cysts and polyps)	
Rare	histocytic necrotising lymphadenitis (Kikuchi lymphadenitis)
Blood and lymphatic system disorders	
Uncommon	eosinophilia
Immune system disorders	
Common	infusion related reaction ^b
Uncommon	anaphylactic reaction ^b , hypersensitivity
Endocrine disorders	
Common	hyperglycaemia ^b , hypothyroidism, hyperthyroidism
Uncommon	adrenal insufficiency, hypopituitarism, hypophysitis, thyroiditis, diabetic ketoacidosis
Rare	diabetes mellitus
Metabolism and nutrition disorders	
Very common	decreased appetite
Uncommon	dehydration, metabolic acidosis
Hepatobiliary disorders	
Uncommon	hepatitis ^b , hyperbilirubinaemia
Rare	cholestasis
Nervous system disorders	
Common	peripheral neuropathy, headache, dizziness
Uncommon	polyneuropathy
Rare	Guillain-Barré syndrome, demyelination, myasthenic syndrome, autoimmune neuropathy (including facial and abducens nerve paresis)
Eye disorders	
Common	vision blurred, dry eye
Uncommon	uveitis
Cardiac disorders	
Uncommon	tachycardia
Rare	arrhythmia (including ventricular arrhythmia) ^c , atrial fibrillation
Vascular disorders	
Common	hypertension
Uncommon	vasculitis
Respiratory, thoracic and mediastinal disorders	
Common	pneumonitis ^{a,b} , dyspnoea, cough
Uncommon	pleural effusion
Rare	lung infiltration
Gastrointestinal disorders	
Very common	diarrhoea, nausea
Common	colitis, stomatitis, vomiting, abdominal pain, constipation, dry mouth
Uncommon	pancreatitis
Rare	gastritis, duodenal ulcer
Skin and subcutaneous tissue disorders	
Very common	rash ^d , pruritus
Common	vitiligo, dry skin, erythema, alopecia
Uncommon	erythema multiforme, psoriasis, rosacea, urticaria
Rare	toxic epidermal necrolysis ^{a,e}

Musculoskeletal and connective tissue disorders	
Common	musculoskeletal pain ^f , arthralgia
Uncommon	polymyalgia rheumatica, arthritis
Rare	myopathy
Renal and urinary disorders	
Uncommon	renal failure ^{a,b} , tubulointerstitial nephritis
General disorders and administration site conditions	
Very common	fatigue
Common	pyrexia, oedema (including peripheral oedema)
Uncommon	pain, chest pain
Investigations^g	
Very common	increased AST, increased ALT, increased alkaline phosphatase, increased lipase, increased amylase, increased creatinine, lymphopenia, leukopenia, thrombocytopenia, anaemia, hypercalcaemia, hyperkalaemia, hypokalaemia, hypomagnesaemia, hyponatraemia
Common	increased total bilirubin, neutropenia, hypermagnesaemia, hypernatraemia, hypocalcaemia, weight decreased

- ^a Fatal cases have been reported in completed or ongoing clinical studies.
- ^b Life-threatening cases have been reported in completed or ongoing clinical studies
- ^c The frequency of adverse events in the cardiac disorders system organ class regardless of causality was higher in the nivolumab group than in the chemotherapy group in post-CTLA4/BRAF inhibitor metastatic melanoma population. Incidence rates per 100 person-years of exposure were 9.3 vs 0; serious cardiac events were reported by 4.9% patients in the nivolumab group vs 0 in the investigator's choice group. The frequency of cardiac adverse events was lower in the nivolumab group than in the dacarbazine group in the metastatic melanoma without prior treatment population. All were considered not related to nivolumab by investigators except arrhythmia (atrial fibrillation, tachycardia and ventricular arrhythmia).
- ^d Rash is a composite term which includes maculopapular rash, rash erythematous, rash pruritic, rash follicular, rash macular, rash morbilliform, rash papular, rash pustular, rash papulosquamous, rash vesicular, rash generalized, dermatitis, dermatitis acneiform, dermatitis allergic, dermatitis atopic, dermatitis bullous, dermatitis exfoliative, dermatitis psoriasiform, drug eruption.
- ^e Reported in studies outside the pooled dataset. The frequency is based on the program-wide exposure.
- ^f Musculoskeletal pain is a composite term which includes back pain, bone pain, musculoskeletal chest pain, musculoskeletal discomfort, myalgia, neck pain, pain in extremity, spinal pain.
- ^g Frequencies of laboratory abnormalities reflect the proportion of patients who experienced a worsening from baseline in laboratory measurements.

Description of selected adverse reactions

Data for the following immune-related adverse reactions are based on patients that received nivolumab 3 mg/kg monotherapy in seven clinical studies in melanoma, non-small cell lung carcinoma (NSCLC) and RCC. The management guidelines for these adverse reactions are described in section 4.4.

Immune-related pneumonitis

The incidence of pneumonitis, including interstitial lung disease (ILD), was 3.2% (56/1728). The majority of cases were Grade 1 or 2 in severity reported in 0.7% (12/1728) and 1.7% (29/1728) of patients respectively. Grade 3 and 4 cases were reported in 0.8% (14/1728) and <0.1% (1/1728) of patients respectively. No Grade 5 case was reported.

Median time to onset was 3.6 months (range: 0.4-19.6). Forty-one patients received high-dose corticosteroids (at least 40 mg prednisone equivalents) at a median initial dose of 1.2 mg/kg (range: 0.5-17.6) for a median duration of 3.6 weeks (range: 0.1-13.1). Fourteen patients (0.8%), 13 with Grade 3

and 1 with Grade 4, required permanent discontinuation of nivolumab. Resolution occurred in 47 patients (84%) with a median time to resolution of 5.3 weeks (range: 0.6-53.1⁺); ⁺ denotes a censored observation.

Immune-related colitis

The incidence of diarrhoea or colitis was 13.6% (235/1728). The majority of cases were Grade 1 or 2 in severity reported in 9.0% (156/1728) and 3.0% (52/1728) of patients respectively. Grade 3 cases were reported in 1.6% (27/1728) of patients. No Grade 4 or 5 cases were reported.

Median time to onset was 1.8 months (range: 0.0-20.9). Thirty-four patients received high-dose corticosteroids (at least 40 mg prednisone equivalents) at a median initial dose of 0.9 mg/kg (range: 0.4-4.7) for a median duration of 3.0 weeks (range: 0.4-40.3). Twelve patients (0.7%) with Grade 3 diarrhoea or colitis required permanent discontinuation of nivolumab. Resolution occurred in 207 patients (89%) with a median time to resolution of 2.1 weeks (range: 0.1-88.3⁺).

Immune-related hepatitis

The incidence of liver function test abnormalities was 7.0% (121/1728). The majority of cases were Grade 1 or 2 in severity reported in 3.9% (68/1728) and 1.3% (22/1728) of patients respectively. Grade 3 and 4 cases were reported in 1.4% (25/1728) and 0.3% (6/1728) of patients, respectively. No Grade 5 case was reported.

Median time to onset was 1.9 months (range: 0.0-18.7). Nineteen patients received high-dose corticosteroids (at least 40 mg prednisone equivalents) at a median initial dose of 1.0 mg/kg (range: 0.4-4.7) for a median duration of 4.0 weeks (range: 0.4-8.9). Fifteen patients (0.9%), 11 with Grade 3 and 4 with Grade 4 liver function test abnormalities, required permanent discontinuation of nivolumab. Resolution occurred in 95 patients (79%) with a median time to resolution of 5.1 weeks (range: 0.1-82.6⁺).

Immune-related nephritis and renal dysfunction

The incidence of nephritis and renal dysfunction was 3.2% (55/1728). The majority of cases were Grade 1 or 2 in severity reported in 1.9% (32/1728) and 0.8% (14/1728) of patients respectively. Grade 3 and 4 cases were reported in 0.5% (8/1728) and <0.1% (1/1728) of patients, respectively. No Grade 5 nephritis or renal dysfunction was reported.

Median time to onset was 2.3 months (range: 0.0-18.2). Fifteen patients received high-dose corticosteroids (at least 40 mg prednisone equivalents) at a median initial dose of 0.8 mg/kg (range: 0.5-2.1) for a median duration of 3 weeks (range: 0.1-67.0). Two patients (0.1%), 1 with Grade 3 and 1 with Grade 4 nephritis or renal dysfunction required permanent discontinuation of nivolumab. Resolution occurred in 33 patients (62%) with a median time to resolution of 11.1 weeks (range: 0.1-77.1⁺).

Immune-related endocrinopathies

The incidence of thyroid disorders, including hypothyroidism or hyperthyroidism, was 8.6% (149/1728). The majority of cases were Grade 1 or 2 in severity reported in 3.6% (62/1728) and 4.9% (85/1728) of patients respectively. Grade 3 thyroid disorders were reported in 0.1% (2/1728) of patients. Hypophysitis (1 Grade 1; 1 Grade 2, and 3 Grade 3), adrenal insufficiency (1 Grade 1; 5 Grade 2; and 4 Grade 3), diabetes mellitus (1 Grade 2), and diabetic ketoacidosis (2 Grade 3) were reported. No Grade 4 or 5 cases were reported

Median time to onset of these endocrinopathies was 2.8 months (range: 0.4-14.0). Eleven patients received high-dose corticosteroids (at least 40 mg prednisone equivalents) at an initial dose of 0.8 mg/kg (range: 0.5-2.2) for a median duration of 1.6 weeks (range 0.1-4.9). Two Patients (0.1%) with Grade 3 endocrinopathies required permanent discontinuation of nivolumab. Resolution occurred in 74 patients (45%) with a median time to resolution of 66.6 weeks (0.4-96.1⁺).

Immune-related rash

The incidence of rash was 28.0% (484/1728). The majority of cases were Grade 1 in severity reported in 21.9% (378/1728) of patients. Grade 2 and Grade 3 cases were reported in 5.2% (89/1728) and 1.0% (17/1728) of patients respectively. No Grade 4 or 5 cases were reported.

Median time to onset was 1.4 months (range: 0.0-17.2). Eighteen patients received high dose corticosteroids (at least 40 mg prednisone equivalents) at an initial dose of 0.9 mg/kg (range: 0.4-2.7) for a median duration of 2.1 weeks (range: 0.1-38.7). Three patients (0.2%) with Grade 3 rash required permanent discontinuation of nivolumab. Resolution occurred in 295 patients (62%) with a median time to resolution of 18.1 weeks (0.1-113.7+).

Infusion reactions

The incidence of hypersensitivity/infusion reactions was 4.1% (71/1728), including 3 Grade 3 and 2 Grade 4 cases.

Laboratory abnormalities

The proportion of patients who experienced a shift from baseline to a Grade 3 or 4 laboratory abnormality was as follows: 4.4% for anaemia (all Grade 3), 0.4% for thrombocytopenia, 7.7% for lymphopenia, 0.5% for neutropenia, 1.7% for increased alkaline phosphatase, 2.7% for increased AST, 2.4% for increased ALT, 1.0% for increased total bilirubin, 0.8% for increased creatinine, 2.4% for increased amylase, 8.0% for increased lipase, 5.9% for hyponatraemia, 2.1% for hyperkalaemia, 1.5% for hypokalaemia, 1.3% for hypercalcaemia, 0.8% for hypermagnesaemia, 0.5% for hypomagnesaemia, 0.6% for hypocalcaemia, 0.5% for leukopenia, and 0.1% for hypernatraemia.

Immunogenicity

As with all therapeutic proteins, there is a potential for an immune response to nivolumab. Of the 1408 patients who were treated with nivolumab 3 mg/kg every 2 weeks and evaluable for the presence of anti-product antibodies, 155 (11.0%) patients tested positive for treatment-emergent anti-product antibodies by an electrochemiluminescent (ECL) assay. Only 2 (0.1%) patients were persistent positive. Neutralising antibodies were detected in only 9 (0.6% of the total) of the positive anti-product antibody patients. There was no evidence of altered pharmacokinetic or toxicity profile associated with anti-product antibody development.

4.9 Overdose

No cases of overdose have been reported in clinical trials. In case of overdose, patients should be closely monitored for signs or symptoms of adverse reactions, and appropriate symptomatic treatment instituted immediately.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Antineoplastic agents, monoclonal antibodies. ATC code: L01XC17.

Mechanism of action

Nivolumab is a human immunoglobulin G4 (IgG4) monoclonal antibody (HuMAb), which binds to the programmed death-1 (PD-1) receptor and blocks its interaction with PD-L1 and PD-L2. The PD-1 receptor is a negative regulator of T-cell activity that has been shown to be involved in the control of T-cell immune responses. Engagement of PD-1 with the ligands PD-L1 and PD-L2, which are expressed in antigen presenting cells and may be expressed by tumours or other cells in the tumour microenvironment, results in inhibition of T-cell proliferation and cytokine secretion. Nivolumab potentiates T-cell responses, including anti-tumour responses, through blockade of PD-1 binding to PD-L1 and PD-L2 ligands. In syngeneic mouse models, blocking PD-1 activity resulted in decreased tumour growth.

Clinical efficacy and safety

Randomised phase 3 study vs. everolimus (CA209025)

The study included patients (18 years or older) who had experienced disease progression during or after 1 or 2 prior anti-angiogenic therapy regimens and no more than 3 total prior systemic treatment regimens. Patients had to have a Karnofsky Performance Score (KPS) $\geq 70\%$. This study included patients regardless of their tumour PD-L1 status. Patients with any history of or concurrent brain metastases, prior treatment with an mammalian target of rapamycin (mTOR) inhibitor, active autoimmune disease, or medical conditions requiring systemic immunosuppression were excluded from the study.

A total of 821 patients were randomised to receive either nivolumab 3 mg/kg (n=410) administered intravenously over 60 minutes every 2 weeks or everolimus (n=411) 10 mg daily, administered orally. Treatment was continued as long as clinical benefit was observed or until treatment was no longer tolerated. The first tumour assessments were conducted 8 weeks after randomisation and continued every 8 weeks thereafter for the first year and then every 12 weeks until progression or treatment discontinuation, whichever occurred later. Tumour assessments were continued after treatment discontinuation in patients who discontinued treatment for reasons other than progression. Treatment beyond initial investigator-assessed Response Evaluation Criteria in Solid Tumors (RECIST) 1.1-defined progression was permitted if the patient had a clinical benefit and was tolerating study drug as determined by the investigator. The primary efficacy outcome measure was overall survival (OS). Secondary efficacy assessments included investigator-assessed objective response rate (ORR) and progression-free survival (PFS).

Baseline characteristics were generally balanced between the two groups. The median age was 62 years (range: 18-88) with 40% ≥ 65 years of age and 9% ≥ 75 years of age. The majority of patients were male (75%) and white (88%), all Memorial Sloan Kettering Cancer Center (MSKCC) risk groups were represented, and 34% and 66% of patients had a baseline KPS of 70 to 80% and 90 to 100%, respectively. The majority of patients (72%) had been treated with one prior anti-angiogenic therapy. The median duration of time from initial diagnosis to randomisation was 2.6 years in both the nivolumab and everolimus groups. The median duration of treatment was 5.5 months (range: 0- 29.6+ months) in nivolumab-treated patients and 3.7 months (range: 6 days-25.7+ months) in everolimus-treated patients. Nivolumab was continued beyond progression in 44% of patients.

The Kaplan-Meier curves for OS are shown in Figure 1 and the efficacy results are summarised in Table 3.

OS benefit was observed regardless of tumour PD-L1 expression level.

The Functional Assessment of Cancer Therapy-Kidney Symptom Index-Disease Related Symptoms (FKSI-DRS) subscale of the FKSI-15 was used to assess disease-related symptom progression rate in each treatment arm. With a completion rate of 80% in the first year, nivolumab demonstrated a favourable impact on disease-related symptom progression rate. The scores for the nivolumab group increased over time and differed significantly from median changes in the everolimus group at each assessment point through week 104.

Figure 1: Kaplan-Meier curves of OS (CA209025)

Number of Subjects at Risk	
Nivolumab	410 389 359 337 305 275 213 139 73 29 3 0
Everolimus	411 366 324 287 265 241 187 115 61 20 2 0

Table 3: Efficacy Results (CA209025)

	nivolumab (n = 410)	everolimus (n = 411)
Overall survival		
Events (%)	183 (44.6%)	215 (52.3%)
Hazard ratio ^a (98.52% CI)		0.73 (0.57, 0.93)
p-value ^b		0.0018
Median (95% CI) months	25.00 (21.75, NR)	19.55 (17.64, 23.06)
Rate (95% CI) at 6 months	89.2 (85.7, 91.8)	81.2 (77.0, 84.7)
Rate (95% CI) at 12 months	76.0 (71.5, 79.9)	66.7 (61.8, 71.0)
Objective response		
(95% CI)	103 (25.1%) (21.0, 29.6)	22 (5.4%) (3.4, 8.0)
Odds ratio (95% CI)		5.98 (3.68, 9.72)
p-value		< 0.0001
Complete response (CR)	4 (1.0%)	2 (0.5%)
Partial response (PR)	99 (24.1%)	20 (4.9%)
Stable disease (SD)	141 (34.4%)	227 (55.2%)
Median duration of response		
Months (range)	11.99 (0.0, 27.6 ⁺)	11.99 (0.0 ⁺ , 22.2 ⁺)
Median time to response		
Months (range)	3.5 (1.4, 24.8)	3.7 (1.5, 11.2)

Progression-free survival

Events	318 (77.6%)	322 (78.3%)
Hazard ratio	0.88	
95% CI	(0.754, 1.03)	
p-value	0.1135	
Median (95% CI) (months)	4.60 (3.71, 5.39)	4.44 (3.71, 5.52)

"+" denotes a censored observation

NR: not reached

Safety and efficacy in elderly patients

No overall differences in safety or efficacy were reported between elderly (≥ 65 years) and younger patients (< 65 years).

Paediatric population

The European Medicines Agency has deferred the obligation to submit the results of studies with nivolumab in all subsets of the paediatric population in the treatment of malignant solid tumours (see section 4.2 for information on paediatric use).

5.2 Pharmacokinetic properties

The pharmacokinetics (PK) of nivolumab is linear in the dose range of 0.1 to 10 mg/kg. The geometric mean clearance (CL), terminal half-life, and average exposure at steady state at 3 mg/kg every 2 weeks of nivolumab were 9.5 mL/h, 26.7 days, and 75.3 $\mu\text{g/mL}$, respectively, based on a population PK analysis.

Nivolumab CL increased with increasing body weight. Body weight normalised dosing produced approximately uniform steady-state trough concentration over a wide range of body weights (34-162 kg).

The metabolic pathway of nivolumab has not been characterised. Nivolumab is expected to be degraded into small peptides and amino acids via catabolic pathways in the same manner as endogenous IgG.

Special populations

A population PK analysis suggested no difference in CL of nivolumab based on age, gender, race, tumour type, tumour size, and hepatic impairment. Although ECOG status, baseline glomerular filtration rate (GFR), albumin, body weight, and mild hepatic impairment had an effect on nivolumab CL, the effect was not clinically meaningful.

Renal impairment

The effect of renal impairment on the CL of nivolumab was evaluated in patients with mild ($\text{GFR} < 90$ and ≥ 60 mL/min/1.73 m²; n = 379), moderate ($\text{GFR} < 60$ and ≥ 30 mL/min/1.73 m²; n = 179), or severe ($\text{GFR} < 30$ and ≥ 15 mL/min/1.73 m²; n = 2) renal impairment compared to patients with normal renal function ($\text{GFR} \geq 90$ mL/min/1.73 m²; n = 342) in population PK analyses. No clinically important differences in the CL of nivolumab were found between patients with mild or moderate renal impairment and patients with normal renal function. Data from patients with severe renal impairment are too limited to draw conclusions on this population (see section 4.2).

Hepatic impairment

The effect of hepatic impairment on the CL of nivolumab was evaluated in patients with mild hepatic impairment (total bilirubin $1.0 \times$ to $1.5 \times$ ULN or AST $>$ ULN as defined using the National Cancer Institute criteria of hepatic dysfunction; n = 92) compared to patients with normal hepatic function (total bilirubin and AST \leq ULN; n = 804) in the population PK analyses. No clinically important differences in the CL of nivolumab were found between patients with mild hepatic impairment and normal hepatic function. Nivolumab has not been studied in patients with moderate (total bilirubin $> 1.5 \times$ to $3 \times$ ULN and any AST) or severe hepatic impairment (total bilirubin $> 3 \times$ ULN and any AST) (see section 4.2).

5.3 Preclinical safety data

Blockade of PD-L1 signalling has been shown in murine models of pregnancy to disrupt tolerance to the fetus and to increase fetal loss. The effects of nivolumab on prenatal and postnatal development were evaluated in monkeys that received nivolumab twice weekly from the onset of organogenesis in the first trimester through delivery, at exposure levels either 8 or 35 times higher than those observed at the clinical dose of 3 mg/kg of nivolumab (based on AUC). There was a dose-dependent increase in fetal losses and increased neonatal mortality beginning in the third trimester.

The remaining offspring of nivolumab-treated females survived to scheduled termination, with no treatment-related clinical signs, alterations to normal development, organ-weight effects, or gross and microscopic pathology changes. Results for growth indices, as well as teratogenic, neurobehavioral, immunological, and clinical pathology parameters throughout the 6-month postnatal period were comparable to the control group. However, based on its mechanism of action, foetal exposure to nivolumab may increase the risk of developing immune-related disorders or altering the normal immune response and immune-related disorders have been reported in PD-1 knockout mice.

Fertility studies have not been performed with nivolumab.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Sodium citrate dihydrate
Sodium chloride
Mannitol (E421)
Pentetic acid (diethylenetriaminepentaacetic acid)
Polysorbate 80
Sodium hydroxide (for pH adjustment)
Hydrochloric acid (for pH adjustment)
Water for injections

6.2 Incompatibilities

In the absence of compatibility studies, this medicinal product must not be mixed with other medicinal products. Nivolumab should not be infused concomitantly in the same intravenous line with other medicinal products.

6.3 Shelf life

Unopened vial

2 years.

After opening

From a microbiological point of view, once opened, the medicinal product should be infused or diluted and infused immediately.

After preparation of infusion

From a microbiological point of view, the product should be used immediately.

If not used immediately, chemical and physical in-use stability of nivolumab has been demonstrated for 24 hours at 2°C to 8°C protected from light and a maximum of 4 hours at 20°C-25°C and room light (this 4-hour period of the total 24 hours should be inclusive of the product administration period).

6.4 Special precautions for storage

Store in a refrigerator (2°C-8°C).

Do not freeze.

Store in the original package in order to protect from light.

For storage conditions after preparation of the infusion, see section 6.3.

6.5 Nature and contents of container

10 mL of concentrate in a 10 mL vial (Type I glass) with a stopper (coated butyl rubber) and a grey flip-off seal (aluminium). Pack size of 1 vial.

6.6 Special precautions for disposal and other handling

Preparation should be performed by trained personnel in accordance with good practices rules, especially with respect to asepsis.

Preparation and administration

Calculating the dose

The prescribed dose for the patient is given in mg/kg. Based on this prescribed dose, calculate the total dose to be given. More than one vial of nivolumab concentrate may be needed to give the total dose for the patient.

- The total nivolumab dose in mg = the patient's weight in kg × the prescribed dose in mg/kg.
- The volume of nivolumab concentrate to prepare the dose (mL) = the total dose in mg, divided by 10 (the nivolumab concentrate strength is 10 mg/mL).

Preparing the infusion

Take care to ensure aseptic handling when you prepare the infusion. The infusion should be prepared in a laminar flow hood or safety cabinet using standard precautions for the safe handling of intravenous agents.

Nivolumab can be used for intravenous administration either:

- without dilution, after transfer to an infusion container using an appropriate sterile syringe; or
- after diluting to concentrations as low as 1 mg/mL. The final infusion concentration should range between 1 and 10 mg/mL. Nivolumab concentrate may be diluted with either:
 - sodium chloride 9 mg/mL (0.9%) solution for injection; or
 - 50 mg/mL (5%) glucose solution for injection.

STEP 1

- Inspect the nivolumab concentrate for particulate matter or discoloration. Do not shake the vial. Nivolumab concentrate is a clear to opalescent, colourless to pale yellow liquid that may contain few light particles.
- Withdraw the required volume of nivolumab concentrate using an appropriate sterile syringe.

STEP 2

- Transfer the concentrate into a sterile, evacuated glass bottle or intravenous container (PVC or polyolefin).
- If applicable, dilute with the required volume of sodium chloride 9 mg/mL (0.9%) solution for injection or 50 mg/mL (5%) glucose solution for injection. Gently mix the infusion by manual rotation. Do not shake.

Administration

Nivolumab infusion must not be administered as an intravenous push or bolus injection.

Administer the nivolumab infusion intravenously over a period of 60 minutes. Nivolumab infusion should not be infused at the same time in the same intravenous line with other agents. Use a separate infusion line for the infusion.

Use an infusion set and an in-line, sterile, non-pyrogenic, low protein binding filter (pore size of 0.2 µm to 1.2 µm).

Nivolumab infusion is compatible with PVC and polyolefin containers, glass bottles, PVC infusion sets and in-line filters with polyethersulfone membranes with pore sizes of 0.2 µm to 1.2 µm.

After administration of the nivolumab dose, flush the line with sodium chloride 9 mg/mL (0.9%) solution for injection or 50 mg/mL (5%) glucose solution for injection.

Disposal

Do not store any unused portion of the infusion solution for reuse. Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. SCIENTIFIC OPINION HOLDER

Bristol-Myers Squibb Pharmaceuticals Limited
Uxbridge Business Park
Sanderson Road
Uxbridge UB8 1DH
United Kingdom

8. EAMS NUMBER

15105/0003

9. DATE OF SCIENTIFIC OPINION

05/02/2016

Additional information

Each prescribing oncologist will have to complete a short **Initial Drug Supply and Case Report Form** to ensure eligibility within the scheme and to collect anonymised patient data.

An **Informed Consent Form (ICF)** will be provided to be completed with the patient.

A **Letter of Agreement (LoA)** will be signed by the prescribing oncologist and a legal representative from the trust or the health board, when the oncologist applies for their first patient. For subsequent patients under the care of the same oncologist, BMS will provide the LoA signed for the first patient, and the oncologist will provide confirmation that they agree to abide by the terms set out in the LoA.

BMS will arrange training (including adverse event training) and delivery of the programme materials, including the following:

- **Adverse Reaction Management Guide**
This guide will ensure understanding of the immunologic aetiology of important adverse reactions, the requirement for more frequent monitoring and/or unique interventions and the guidelines for the management of adverse reactions.
- **Patient Alert Card**
This is a wallet-sized card to be carried at all times to show at all medical visits to HCPs other than the prescriber (e.g., emergency HCPs). It has contact details of the treating physician and it alerts other physicians that the patient is treated with Nivolumab.

A **Drug Re-supply and Case Report Form** which will be provided to order further drug supplies.

The prescribing oncologist will be required to complete **the Drug Re-supply and Case Report Form** every four weeks (except for the first re-supply which will be after two weeks) to order the next two treatment cycles of Nivolumab for the patient. The order should be placed two weeks before the next planned cycle is due.

The prescribing oncologist is requested to inform BMS if a patient discontinues treatment by emailing RCC.EAMS@BMS.COM with the last date of treatment.

Contact information

To initiate the registration process for EAMS oncologists are required to obtain an **Informed Consent Form (ICF)** and **Initial Drug Supply and Case Report Form** from BMS by sending

- either an email to RCC.EAMS@BMS.COM
- or by following the link from the Bristol-Myers Squibb website for UK EAMS Renal Cell Carcinoma (RCC) patients:
http://www.bms.com/clinical_trials/investigator_sponsored_research/Pages/expanded-access-program.aspx; this link will take you to an application form to ensure eligibility within the scheme (see above)

For NHS England

On receipt of these forms by the oncologist, the ICF should then be completed with the patient and an **NHS EAMS Application form** should be submitted to england.eams@nhs.net to register the patient with NHS England. The NHS application form itself can be requested from the same dedicated NHS EAMS email address above.

Following patient registration with NHS England, the oncologist may proceed to request drug supply from BMS (using the unique approval number provided by NHS England) for that patient by completing the **Initial Drug Supply and Case Report Form** with additional eligibility information and sending this to RCC.EAMS@BMS.COM. A copy of the NHS approval e-mail for the patient must also be sent with the form.

For NHS Wales and Scotland

On receipt of these forms by the oncologist, the ICF should then be completed with the patient. The oncologist may then proceed to request drug supply from BMS for that patient by completing the **Initial Drug Supply and Case Report Form** with additional eligibility information and sending this to RCC.EAMS@BMS.COM. BMS will assign a unique patient EAMS number to be used in any future communications.
