Diagnostic indicators

Year: 2016 Week: 45

Key messages

Data to: 13 November 2016

During week 45 GP consultations increased for a range of respiratory conditions including upper and lower respiratory tract infection and pneumonia (figures 1, 5 and 6).

There were also increases in gastroenteritis and vomiting consultations in week 45, mainly in the under 5 years age groups (figures 7, 7a and 8, 8a).

A Cold Watch System operates in England from 1 November to 31 March each year. As part of the Public Health England Cold Weather Plan for England the PHE Real-time Syndromic Surveillance team will be monitoring the impact of cold weather on syndromic surveillance data during this period. Cold weather alert level (current reporting week): Level 1/2 Winter Preparedness and Action/Alert and Readiness http://www.metoffice.gov.uk/weather/uk/coldweatheralert/

Diagnostic indicators at a glance:

U U		
Indicator	Trend	Level
Upper respiratory tract infection	increasing	similar to baseline levels
Influenza-like illness	no trend	similar to baseline levels
Pharyngitis	no trend	below baseline levels
Scarlet fever	no trend	similar to baseline levels
Lower respiratory tract infection	increasing	above baseline levels
Pneumonia	increasing	above baseline levels
Gastroenteritis	increasing	similar to baseline levels
Vomiting	increasing	above baseline levels
Diarrhoea	no trend	below baseline levels
Severe asthma	increasing	above baseline levels
Wheeze	no trend	above baseline levels
Conjunctivitis	no trend	below baseline levels
Mumps	no trend	similar to baseline levels
Measles	no trend	below baseline levels
Rubella	no trend	similar to baseline levels
Pertussis	decreasing	below baseline levels
Chickenpox	no trend	below baseline levels
Herpes zoster	no trend	similar to baseline levels
Cellulitis	decreasing	similar to baseline levels
Impetigo	increasing	above baseline levels

GP practices and denominator population:

Year	Week	GP Practices Reporting**	Population size**
2016	45	4,182	33.0 million

**based on the average number of practices and denominator population in the reporting working week.

15 November 2016

戀

Public Health England

1: Upper respiratory tract infection (URTI)

Daily incidence rate (and 7-day moving average*) per 100,000 population (all England, all ages).

1a: Upper respiratory tract infection by age

Average daily incidence rate by week per 100,000 population (all England) based on a population denominator of approximately 5.5 million patients).

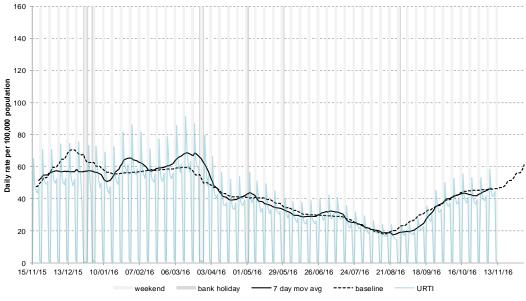

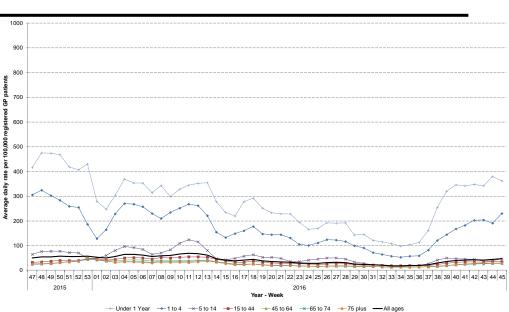

Daily incidence rates (and 7-day moving average*) per 100,000 population (all England, all ages).

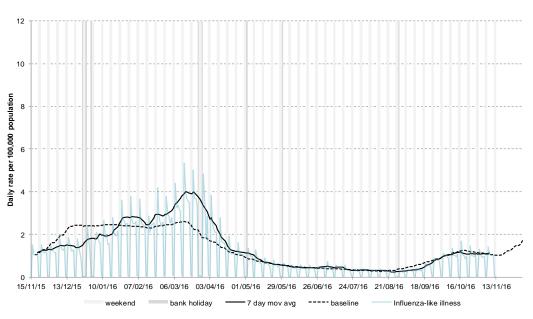

* 7-day moving average adjusted for bank holidays.

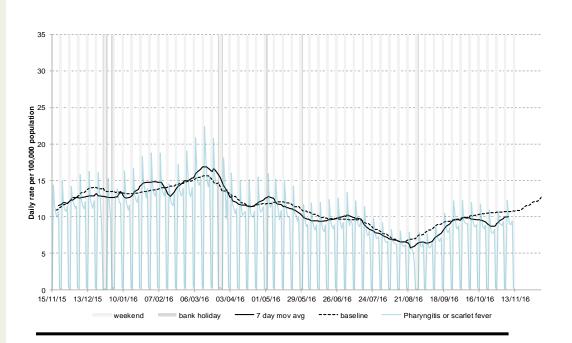

15 November 2016

3: Pharyngitis or

scarlet fever

Daily incidence rates (and 7-day moving average*) per 100,000 population (all England, all ages).

Intentionally left blank.

Intentionally left blank.

* 7-day moving average adjusted for bank holidays.

Notes and further information	 The Public Health England GP in hours surveillance system is a syndromic surveillance system monitoring community-based morbidity recorded by GP practices. 		
	 GP consultation data are analysed on a daily basis to identify national and regional trends. A statistical algorithm underpins each system, routinely identifying activity that has increased significantly or is statistically significantly high for the time of year. Results from these daily analyses are assessed by the ReSST, along with analysis by age group, and anything deemed of public health importance is alerted by the team. 		
	• This system captures anonymised GP morbidity data from two GP clinical software systems, EMIS, from version 1 of the QSurveillance® database, and TPP SystmOne.		
	• Baselines represent seasonally expected levels of activity and are constructed from historical data. Furthermore, they take into account any known substantial changes in data collection, population coverage or reporting practices. Baselines are refreshed using the latest data on a regular basis.		
Maps:	• From week 40 2015 the influenza-like illness thresholds illustrated in the bulletin appendix maps are calculated using the "Moving Epidemic Method" (MEM). ¹ MEM is used as a standard methodology for setting influenza surveillance thresholds across Europe. ²		
	• The ILI thresholds have been calculated separately for each of the nine PHE Centres to allow for structural differences between areas e.g. background rates are historically higher in London than other areas of England.		
	• The current ILI thresholds are based on six previous influenza seasons (excluding the 2009/10 H1N1 pandemic). In future, thresholds will be recalculated each year incorporating the latest season's data.		
	 The maps on the following pages contains Ordnance Survey data © Crown copyright and database right 2014. Contains National Statistics data © Crown copyright and database right 2014. 		
	 ¹ Vega T et al. Influenza Other Respir Viruses. 2013;7(4):546-58. ² Green HK et al. Epidemiol Infect. 2015;143(1):1-12. 		
Acknowledgements:	We thank and acknowledge the University of Nottingham, ClinRisk [®] and the contribution of EMIS and EMIS practices. Data source: version 1 of the QSurveillance® database.		
	We thank TPP, ResearchOne and the SystmOne GP practices contributing to this surveillance system.
