Courgette

Pesticide Residues Monitoring Report 2015

This is an amalgamation of the quarterly reports

Introduction

Courgettes, also known as zucchini, were last surveyed in 2011 as part of the rolling programme. This year the survey included any type of green or yellow courgette.

We sampled courgettes in quarters three and four, we reported on it in quarter four only.

A market research company bought the courgette samples from retail outlets across the UK.

Conclusions

Summary statement

None of the residues detected by the laboratory would be expected to have an effect on health.

Results

When samples were taken	Between July and November 2015
Number of samples	48 samples were tested for up to 333 pesticide residues
Origin of samples	25 samples came from the UK 23 samples came from the EU
Residues found	27 samples contained no residues from those sought 21 samples contained residues above the reporting level None of the samples contained residues above the MRL 3 samples were labelled as organic. None contained residues from those sought
Multiple residues	9 samples contained residues of more than one pesticide <ul style="list-style-type: none">• 8 samples contained 2 residues• 1 sample contained 3 residues

Risk assessments

Number of risk assessments	The laboratory detected 10 different pesticide residues. Following the Chemicals Regulation Directorate (CRD)'s risk assessment, we do not expect these residues to have an effect on health.
Combined risk assessments	<p>Some samples contained residues of more than one pesticide. When samples contain more than one pesticide belonging to the groups that CRD usually assess, where toxicologists expect these to add to each other's effect (have the same toxicological mode of action), CRD carry out a risk assessment of the combined residues.</p> <p>In this case CRD did not carry out any risk assessments of combined residues because the laboratory did not find residues belonging to these groups with similar toxicological modes of action in any samples.</p>
