Figure 1: Site map – Fylde marine conservation zone (MCZ)

1. Introduction

The Marine Management Organisation (MMO) is conducting marine protected area (MPA) assessments to ensure current and potential commercial fishing activities in MPAs in English inshore waters (0 to 12 nautical miles (nm)) are appropriately managed.

To ensure our findings and conclusions are robust and are based on the best available evidence, we are inviting you to review the executive summary along with the part assessment, if required, and submit any additional relevant evidence that could contribute to this assessments. Evidence will be used to inform management decisions.

All submitted evidence must follow our evidence guidance and be submitted before Monday 12 December (see <u>Approach and Process Overview</u> for more details).

2. Site location and features

Fylde Marine Conservation Zone (MCZ) is located in Liverpool Bay, lying between 3 and 20 km off the Fylde coast and Ribble estuary. The MCZ protects an area of approximately 260 km².

The site lies entirely within International Council for the Exploration of the Sea (ICES) rectangle¹ 36E6.

Fylde MCZ is located next to Shell Flat sandbank, part of the Shell Flat and Lune Deep Special Area of Conservation (SAC) and offers protection to other rich areas of seabed outside of the SAC. The site is co-located within the Liverpool Bay Special Protection Area (SPA) which provides protection for particular bird features including common scoter (*Melanitta nigra*) and red-throated diver (*Gavia stellata*) and their supporting habitats.

Figure 1 shows the location and extent of the features within the site. The site has been designated for subtidal sand and subtidal mud, which both exist throughout the site.

The MCZ assessment covers the interaction of identified fishing gears and designated features for the 6-12nm limit portion of the site.

More information is available in the Fylde MCZ <u>Factsheet</u>.

3. Summary of draft assessment findings

The MMO is currently conducting the assessment. Thus far the MMO has identified those fishing activities that do not occur within the site. The remaining gear/feature interactions have been screened for those where the risk of affecting the protected features could be ruled out.

¹ ICES statistical rectangles are part of a widely used grid system for North Eastern Atlantic waters.

The MMO is now assessing the remaining gear/feature interactions to understand whether there could be a risk of hindrance to the conservation objectives from commercial fishing.

For further details on the assessment please contact: conservation@marinemanagement.org.uk

4. Assessment process

Overview of assessment process

Site assessments include three phases:

- 1. Initial test Is the fishing activity occurring? Is the activity already sufficiently regulated? Is any feasible interaction between the activity and designated feature?
- 2. Part A Is the activity capable of affecting (other than insignificantly) the protected features of the MCZ²?
- 3. Part B Is there a significant risk of the activity hindering the achievement of the conservation objectives of the MCZ?

MPA assessments include current and potential fishing activities. To understand what the potential fishing activities are likely to be, we use historical fishing activity and expert opinion. Further information on potential activities is available on request.

² Including affecting any ecological or geomorphological process on which the conservation of any protected feature of the MCZ (wholly or in part) dependent.

Overview of gears being assessed

Table 1: Activities being assessed for the Fylde MCZ

Phase	Activities
1. Initial test	All fishing gears from Part A, and:
	Anchor seine
	Scottish /fly seine
	Beam trawl (pulse/wing
	Heavy otter trawl
	Multi-rig trawls
	Pair trawl
	Towed (demersal/pelagic)
	Mussels, clams, oysters
	Pump scoop (cockles, clams)
	Suction (cockles)
	Cuttle pots
	Fish traps
	Beach seines/ring nets
	Shrimp push nets
	Fyke and stakenets
	Bait dragging
2. Part A	Beam trawl (whitefish)
	Beam trawl (shrimp)
	Light Otter trawl
	Scallops
	Pots/creels (custracea/gastropods)
	Gill nets
	Trammels
	Entangling
	Drift nets (demersal)

Phase	Activities
3. Part B	Beam trawl (whitefish)
	Beam trawl (shrimp)
	Light Otter trawl
	Scallops
	Pots/creels (custracea/gastropods)
	Gill nets
	Trammels
	Entangling
	Drift nets (demersal)

5. Fisheries activity information

Fisheries access

The boundary of the site fully falls within the 12nm limit, extending across two regulatory jurisdictions; North Western Inshore Fisheries and Conservation Authority 0 to 6nm and MMO 6 to 12nm.

French and Irish vessels have access rights between the 6 – 12nm limits.

Data sources - fishing activity

To determine the levels of fishing activity in this site, the following data sources will be used:

1. Vessel monitoring system (VMS) and fisheries landings data

This data incorporates two sources:

- a. location reports from vessels carrying the European Union mandated VMS (data available for vessels of 15m length and over); and
- b. landings data reported at ICES rectangle level from landings declarations and logbooks.

2. Sightings data

A number of sightings data sources and expert opinion will be included for non-VMS vessels:

 Understanding the distribution and trends in inshore fishing activities and the link to coastal communities: Defra commissioned a project to better understand trends in inshore fisheries, including collating and analysing fisheries sightings data from 2010 to 2012.

- <u>FisherMap data</u> 2012 Marine Conservation Zone Project Stakmap looking at commercial fishing for under 15m vessels with data collated by interviewing industry.
- MMO and IFCA expert opinion on fishing activity: MMO marine officers and
 inshore fisheries and conservation officers will provide information on fishing
 activity within MPAs. Information will include number and size of vessels
 fishing, target species, type and amount of fishing gear used and seasonal
 trends in activity. Confidence levels will be provided alongside expert opinion
 and estimates will be provided where exact numbers were not known.

6. Ecological Information

The MMO will use a number of sources of information to understand the vulnerability⁴ of the feature to each fishing gear type. This will include looking at whether the feature is sensitive³ to each fishing gear type.

The main sources will be from Natural England conservation advice packages, peer reviewed papers and government reports.

Where appropriate, The MMO will categorised sensitivity and fishing effort as 'high', 'medium' and 'low' based on secondary evidence if there is no peer reviewed evidence available. Sensitivity levels will are based on Tillin *et al*, 2010³ and Gibb *et al*, 2014⁴ and overall vulnerability of features to gear intensities on Hall *et al*, 2008⁵.

7. Summary of evidence

Fishing activity

VMS data from 2009 to 2013 and sightings show some activity on the contours of the sandbank and in conjunction with expert opinion fishing effort is classed as low.

Sensitivity of the feature and vulnerability to gears

This will be assessed during Part B of the assessment.

Other activities occurring within the site

This will be assessed during Part B of the assessment.

⁵ Hall, K., Paramor, O.A.L., Robinson, L.A., Winrow-Giffin, A., Frid, C.L.J., Eno, N.C., Dernie, K.M., Sharp, R.A.M., Wyn, G.C, Ramsay, G.C. (2008). Mapping the sensitivity of benthic habitats to fishing in Welsh waters – development of a protocol; CCW (Policy Research) Report No: 8/12. 85pp

8. Management options

Following the completion of the MPA assessment, one of the following management options will be adopted. However, if gaps in evidence come to light during the assessment process; precautionary decisions may need to be made.

Option 1: No management is required

Option 2: Introduce a monitoring and control plan within the site to monitor current and potential activities

Option 3: Reduce or limit pressures on the site features

Option 4: Prohibit fishing activities within the site

9. Next Steps

The MMO will now conduct Part B of the fishery assessment to ascertain whether commercial fishing causes an adverse effect on the integrity of this site.

The MMO will then finalise the assessments and share findings with Natural England who will offer conservation advice.

If management measures are required, these will be subject to formal public consultation.

10. Consultation and evidence

If you have evidence that you think MMO should be considering when writing the site assessment, please visit our <u>website</u>.

Please read the 'Approach and Process Overview' for how to submit evidence.
