

Housing Benefit Entitlement Reductions: Caseload Management Information (CMI)

Data for October 2016 - December 2016 (Quarter 3 2016/17)

Quarterly

Published: 26 April 2017
Great Britain

Official
Experimental

Housing Benefit (HB) is an income related benefit that is intended to help meet housing costs for rented accommodation. By identifying the changes of circumstances that lead to a reduction to entitlement, Local Authorities can prevent or minimise overpayments from occurring, thereby minimising Fraud and Error (F&E).

The CMI score is the proportion of reductions to entitlement expected that were actually found.

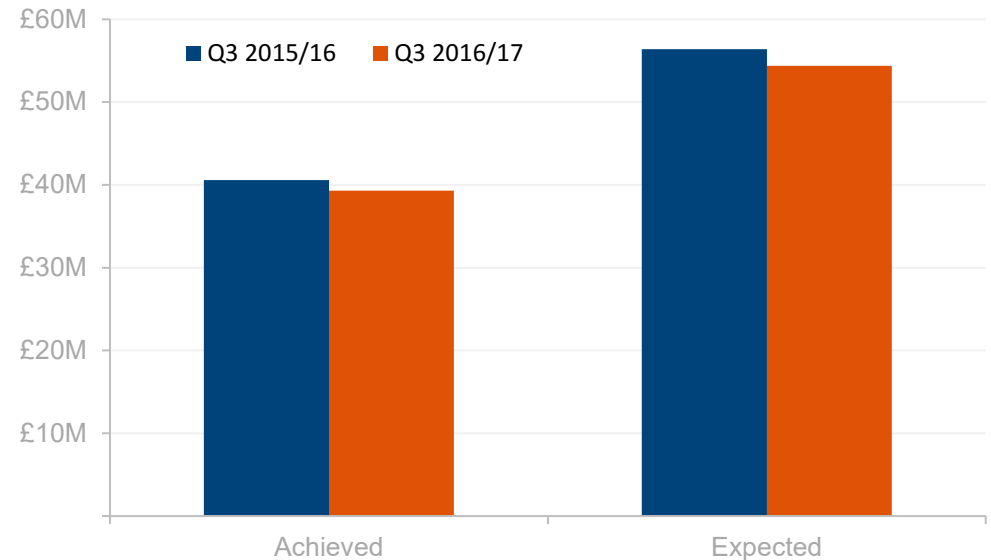

Main stories

- The overall CMI score for Great Britain has risen to 72% in Quarter 3 of 2016/17 after having fallen to its lowest recorded level of 69% in Quarter 2.
- Compared to Quarter 3 2015/16 both the total value of achieved and expected reductions to entitlement has fallen.

CMI score for GB rises from previous lowest score since publication began.

Falling achieved and expected reductions compared to Q3 2015/16.

What you need to know

How is Caseload Management Information calculated?

The statistics are released quarterly in April, July, October and January and are sourced from data originally collected via administrative systems (Single Housing Benefit Extract).

Caseload Management Information (CMI) is an estimate of how well each Local Authority is managing their Housing Benefit (HB) caseload. By identifying the changes of circumstances that lead to a reduction to entitlement, Local Authorities can prevent or minimise overpayments from occurring, thereby minimising Fraud and Error. CMI does not measure the levels of Fraud and Error in Local Authorities nor does it measure how well Local Authorities are identifying or correcting Fraud and Error, but can be used as a proxy.

Caseload Management Information Score is derived from two components:

Actual reductions achieved:

Local Authorities send DWP customer-level data electronically each month in the Single Housing Benefit Extract (SHBE). SHBE provides information on current live HB claims, including entitlement details. By comparing the weekly HB entitlement of individual claims in consecutive monthly SHBE extracts we can identify where the weekly HB entitlement has reduced. The actual reduction achieved by a Local Authority is the sum of the value of these reductions in entitlement observed each month for that Local Authority.

Expected Reductions:

The total value of reductions that we expect a Local Authority could find is dependent on the size of its individual caseload, the types of claimants in that caseload and the value of the reductions that tend to occur in that caseload, which will be partially a consequence of the rent levels found in that Local Authority.

The CMI score is the proportion of reductions to entitlement expected that were actually found - the achieved divided by the expected. This does mean that any Local Authority that is identifying more reductions to entitlement than expected can have a score of greater than 100%.

Geographical Breakdown of CMI scores.

Scotland CMI score is more than 7% higher than England and Wales

Map of CMI score by LA, with exploded view of London

The map of Great Britain by Local Authority shows the CMI score for each LA in Quarter 3 of 2016/17. The darker the shade of blue, the higher the CMI score. Due to the very dense population of Local Authorities in London, the area has been removed from the main body of the map and expanded at the side.

Scottish Local Authorities have consistently achieved higher CMI scores than England and Wales and Q3 2016/17 is no different, although the gap has shrunk slightly since last quarter. London LAs have the lowest regional score with an average CMI score of 66%. Other than Scotland the highest scoring region is the East Midlands with an average CMI score of 78%.
