

Environment Agency

Review of an Environmental Permit for an Installation subject to Chapter II of the Industrial Emissions Directive under the Environmental Permitting (England & Wales) Regulations 2016 (as amended)

Decision document recording our decision-making process following review of a permit

The Permit number is: EPR/BS5215IZ
The Operator is: Eastham Refinery Limited
The Installation is: Eastham Refinery
This Variation Notice number is: EPR/BS5215IZ/V005

What this document is about

Article 21(3) of the Industrial Emissions Directive (IED) requires the Environment Agency to review conditions in permits that it has issued and to ensure that the permit delivers compliance with relevant standards, within four years of the publication of updated decisions on BAT conclusions.

We have reviewed the permit for this installation against the revised BAT Conclusions for the refining of mineral oil and gas industry sector published on 9th October 2014. This is our decision document, which explains the reasoning for the consolidated variation notice that we are issuing.

It explains how we have reviewed and considered the techniques used by the Operator in the operation and control of the plant and activities of the installation. This review has been undertaken with reference to the decision made by the European Commission establishing best available techniques (BAT) conclusions ('BAT Conclusions') for the refining of mineral oil and gas as detailed in document reference IEDC-7-1. It is our record of our decision-making process and shows how we have taken into account all relevant factors in reaching our position. It also provides a justification for the inclusion of any specific conditions in the permit that are in addition to those included in our generic permit template.

As well as considering the review of the operating techniques used by the Operator for the operation of the plant and activities of the installation, the consolidated variation notice takes into account and brings together in a single document all previous variations that relate to the original permit issued. It also modernises the entire permit to reflect the conditions contained in our current generic permit template.

The introduction of new template conditions makes the Permit consistent with our current general approach and philosophy and with other permits issued to installations in this sector. Although the wording of some conditions has changed, while others have been removed because of the new regulatory approach, it does not reduce the level of environmental protection achieved by the Permit in any way. In this document we therefore address only our determination of substantive issues relating to the new BAT Conclusions.

This is our record of our decision-making process and shows how we have taken into account all relevant factors in reaching our position.

Throughout this document we will use a number of expressions. These are as referred to in the glossary and have the same meaning as described in “Schedule 6 Interpretation” of the Permit.

We try to explain our decision as accurately, comprehensively and plainly as possible. We would welcome any feedback as to how we might improve our decision documents in future. A lot of technical terms and acronyms are inevitable in a document of this nature: we provide a glossary of acronyms near the front of the document, for ease of reference.

How this document is structured

Glossary of terms

- 1 Our decision
- 2 How we reached our decision
- 2.1 Requesting information to demonstrate compliance with BAT
Conclusions for the refining of mineral oil and gas
- 2.2 Review of our own information in respect to the capability of the
installation to meet revised standards included in the BAT Conclusions
document
- 3 The legal framework
- 4 Key Issues
- 5 Decision checklist regarding relevant BAT Conclusions
- 6 Emissions to Water
- 7 Additional IED Chapter II requirements
- 8 Review and assessment of changes that are not part of the BAT
Conclusions derived permit review

Annex 1: BAT conclusions for the Refining of Mineral Oil and Gas.

Annex 2: Improvement Conditions

Glossary of acronyms used in this document

(Please note that this glossary is standard for our decision documents and therefore not all these acronyms are necessarily used in this document.)

BAT	Best Available Technique(s)
BAT-AEL	BAT Associated Emission Level
BATc	BAT conclusion
BREF	Best available techniques reference document
CEM	Continuous emissions monitor
CHP	Combined heat and power
CV	Calorific value
DAA	Directly associated activity – Additional activities necessary to be carried out to allow the principal activity to be carried out
DD	Decision document
Derogation	From BAT AELs stated in BAT Conclusions under specific circumstances as detailed under Article 15(4) of IED where an assessment shows that the achievement of emission levels associated with the best available techniques as described in BAT conclusions would lead to disproportionately higher costs
EAL	Environmental assessment level
ELV	Emission limit value derived under BAT or an emission limit value set out in IED
EMS	Environmental Management System
EPR	Environmental Permitting (England and Wales) Regulations 2016 (SI 2016 No. 1154) as amended
EQS	Environmental quality standard
ERL	Eastham Refinery Limited
Eunomia	Ballinger, Holland & Hogg (2011) Use of Damage Cost Data for BAT Decision Making: Report for the Environment Agency of England & Wales
EWC	European waste catalogue
FCC	Fluid Catalytic Cracking
FGD	Flue Gas Desulphurisation
HMT GB	Her Majesty's Treasury The Green Book - Appraisal and Evaluation in Central Government
IED	Industrial Emissions Directive (2010/75/EU)
IPPCD	Integrated Pollution Prevention and Control Directive (2008/1/EC) – now superseded by IED
LCP	Large Combustion Plant subject to Chapter III of IED
LCPD	Large Combustion Plant Directive (2001/80/EC) – now superseded by IED
MSUL/MSDL	Minimum start up load/minimum shut-down load
NOx	Oxides of nitrogen (NO plus NO ₂ expressed as NO ₂)
PAH	Polycyclic Aromatic Hydrocarbons
PC	Process Contribution
PEC	Predicted Environmental Concentration
PPS	Public participation statement
PR	Public register
RGS	Regulatory Guidance Series
SGN	Sector guidance note

TGN	Technical guidance note
TOC	Total Organic Carbon
WFD	Water Framework Directive (2000/60/EC)

1 Our decision

We have decided to issue the Consolidated Variation Notice to the Operator. This will allow it to continue to operate the Installation, subject to the conditions in the Consolidated Variation Notice.

We consider that, in reaching that decision, we have taken into account all relevant considerations and legal requirements and that the varied permit will ensure that a high level of protection is provided for the environment and human health.

The Consolidated Variation Notice contains many conditions taken from our standard Environmental Permit template including the relevant Annexes. We developed these conditions in consultation with industry, having regard to the legal requirements of the Environmental Permitting Regulations and other relevant legislation. This document does not therefore include an explanation for these standard conditions. Where they are included in the Notice, we have considered the techniques identified by the operator for the operation of their installation, and have accepted that the details are sufficient and satisfactory to make those standard conditions appropriate. This document does, however, provide an explanation of our use of “tailor-made” or installation-specific conditions, or where our Permit template provides two or more options.

2 How we reached our decision

2.1 Requesting information to demonstrate compliance with BAT Conclusions for the refining of mineral oil and gas.

We issued a Notice under Regulation 60(1) of the Environmental Permitting (England and Wales) Regulations 2010 (a Regulation 60 Notice) on 10/11/15 requiring the Operator to provide information to demonstrate how the operation of their installation currently meets, or will subsequently meet, the revised standards described in the relevant BAT Conclusions document.

The Notice also required that where the revised standards are not currently met, the operator should provide information that:

- Describes the techniques that will be implemented before 09/10/18, which will then ensure that operations meet the revised standard, or
- Justifies why standards will not be met by 09/10/18, and confirmation of the date when the operation of those processes will cease within the installation or an explanation of why the revised BAT standard is not applicable to those processes, or
- Justifies why an alternative technique will achieve the same level of environmental protection equivalent to the revised standard described in the BAT Conclusions.

The Regulation 60 Notice response from the Operator was received on 14/01/16.

We considered that the response did not contain sufficient information for us to commence the permit review.

Following discussions with the Operator suitable further information was provided by the Operator on the 10/1/17. An email requesting further information was sent to the Operator on the 18/1/17 and a response was received on the 6/2/17. A further Regulation 60 Notice was served on the operator on the 23/1/17 to correct an error and an omission in the original notice. A response to this Notice was received on the 3/2/17. An updated plan showing emission points was received on 11/04/17.

We have not received any information in relation to the Regulation 60 Notice response that appears to be confidential in relation to any party.

2.2 Review of our own information in respect to the capability of the installation to meet revised standards included in the BAT Conclusions document

Based on our records and previous regulatory activities with the facility we have no reason to consider that the operator will not be able to comply with the conditions that we include in the permit.

In relation to BAT Conclusion(s) 6, 10, 11 and 12 we agree with the operator in respect to their current stated capability as recorded in their Regulation 60 Notice response that improvements are required.

We have therefore included improvement conditions:

- IC3 (BATc 6),
 - IC4 and IC5 (BATc 10 and BATc12) and
 - IC7 (BATc11)
- in the Consolidated Variation Notice, which requires them to upgrade their operational techniques so that the requirements of the BAT Conclusion are delivered by 09/10/18. This is discussed in more detail in Annex 2.

3 The legal framework

The Consolidated Variation Notice will be issued under Regulation 20 of the EPR. The Environmental Permitting regime is a legal vehicle which delivers most of the relevant legal requirements for activities falling within its scope. In particular, the regulated facility is:

- an *installation* as described by the IED;
- subject to aspects of other relevant legislation which also have to be addressed.

We consider that the Consolidated Variation Notice will ensure that the operation of the Installation complies with all relevant legal requirements and that a high level of protection will be delivered for the environment and human health.

We explain how we have addressed specific statutory requirements more fully in the rest of this document.

We have set the ELVs in line with the BAT Conclusions, unless a tighter limit was previously imposed and these limits have been carried forward. The emission limits and monitoring tables have been incorporated into Schedule 3 of the permit.

4 Key Issues

The key issues arising during this permit review are:

- Reviewing the effectiveness of the treatment of effluent at the sewage treatment works to achieve BAT-AELs (BAT 12)
- Reviewing the impact of effluent emissions from the sewage treatment plant to see whether the discharge on the receiving water body (WFD)
- Agreeing an appropriate Leak Detection and Repair Programme to reduce VOC emissions (BAT 6).
- Reviewing the options available for segregation of water streams (BAT 11).

We therefore describe how we determined these issues in most detail in the relevant sections of this document.

5 Decision checklist regarding relevant BAT Conclusions

BAT Conclusions for the refining of mineral oil and gas, were published by the European Commission on 9th October 2014. There are 58 BAT Conclusions.

This annex provides a record of decisions made in relation to each relevant BAT Conclusion applicable to the installation. This annex should be read in conjunction with the Consolidated Variation Notice.

The overall status of compliance with the BAT conclusion is indicated in the table as:

NA	Not Applicable
CC	Currently Compliant
FC	Compliant in the future (within 4 years of publication of BAT conclusions)
NC	Not Compliant
PC	Partially Compliant

BAT Conclusion Number	Summary of BAT Conclusion requirement	Status NA/ CC / FC / NC	Assessment of the installation capability and any alternative techniques proposed by the operator to demonstrate compliance with the BAT Conclusion requirement	Relevant permit condition(s)
General				
1	<p>In order to improve the overall environmental performance of the plants for the refining of mineral oil and gas, BAT is to implement and adhere to an environmental management system (EMS) that incorporates all of the following features:</p> <ul style="list-style-type: none"> i. commitment of the management, including senior management; ii. definition of an environmental policy that includes the continuous improvement of the installation by the management; iii. planning and establishing the necessary procedures, objectives and targets, in conjunction with financial planning and investment; iv. implementation of procedures <ul style="list-style-type: none"> (a) Structure and responsibility (b) Training (c) Communication (d) Employee involvement (e) Documentation (f) Efficient process control (g) Maintenance programmes (h) Emergency preparedness and response (i) Safeguarding compliance with environmental legislation v. checking performance and taking corrective action, paying particular attention to: <ul style="list-style-type: none"> (a) monitoring and measurement (see also the Reference Document on the General Principles of Monitoring) (b) corrective and preventive action (c) maintenance of records (d) independent (where practicable) internal and external auditing in order to determine whether or not the EMS conforms to planned arrangements and has been properly implemented and maintained; vi. review of the EMS and its continuing suitability, adequacy and effectiveness by senior management; vii. following the development of cleaner technologies; viii. consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life; viii. consideration for the environmental impacts from the eventual decommissioning of the installation at the stage of designing a new plant, and throughout its operating life; ix. application of sectoral benchmarking on a regular basis. <p>Applicability. 		Combustion units < 50 MW ⁽³⁾	once a year and after significant fuel changes	or indirect monitoring Direct measurement or indirect monitoring		<p>Only the main process furnace (at 30MWth) is monitored as required by the existing permit. The majority of non-measured emissions are from gas fired units installed in 2015/2016. The frequency of monitoring under the existing permit is every 6 months. However reflecting the minimum monitoring frequency requirement of BAT 4 and the consistent level of compliance demonstrated by the Operator the frequency has been reduced to annually. The test method for NO2: BSEN 14792. Test method for total particulates matter: BSEN 13284-1. The EA has decided not to require monitoring on combustion plant below 20 MW thermal input unless previously required by the permit.</p> <p>N/A</p> <p>N/A</p> <p>N/A</p> <p>CO is currently measured to agreed EA standards. Whilst measured it has not previously been listed in Table S3.1. In line with the requirements with BAT 37 this has been introduced to Table S3.1 for emission point A1. The frequency of monitoring is every 6 months. However reflecting the consistent level of compliance previously demonstrated by the Operator the frequency has been reduced to annually in line with other parameters in line with footnote (5).</p> <p>N/A</p>	
	Sulphur recovery units (SRU)	continuous for SO2 only	Direct measurement or indirect monitoring ⁽⁶⁾				
NH ₃ emissions	All units equipped with SCR or SNCR	continuous	Direct measurement				
CO emissions	Catalytic Cracking and combustion units >= 100MW ⁽³⁾	continuous	Direct measurement				
	Other combustion units	once every 6 months ⁽⁵⁾	Direct measurement				
Metal emissions:	Catalytic cracking	once every 6 months and	Direct measurement				

BAT Conclusion Number	Summary of BAT Conclusion requirement				Status NA/ CC / FC / NC	Assessment of the installation capability and any alternative techniques proposed by the operator to demonstrate compliance with the BAT Conclusion requirement	Relevant permit condition(s)				
	Nickel (Ni) Antimony (Sb) Vanadium (V)	Combustion units ⁽⁸⁾	after significant changes to the unit ⁽⁵⁾	or analysis based on metals content in the catalyst fines and in the fuel		N/A					
	Polychlorinated dibenzodioxins / furans (PCDD/F) emissions	Catalytic reformer	once a year or once a regeneration, whichever is longer	Direct measurement							
	<p>(1) Continuous measurement of SO₂ emissions may be replaced by calculations based on measurements of the sulphur content of the fuel or the feed; where it can be demonstrated that this leads to an equivalent level of accuracy</p> <p>(2) Regarding SO_x, only SO₂ is continuously measured while SO₃ is only periodically measured (e.g. during calibration of the SO₂ monitoring system)</p> <p>(3) Refers to the total rated thermal input of all combustion units connected to the stack where emissions occur.</p> <p>(4) Or indirect monitoring of SO_x</p> <p>(5) Monitoring frequencies may be adapted if, after a period of one year, the data series clearly demonstrate a sufficient stability.</p> <p>(6) SO₂ emissions measurements from SRU may be replaced by continuous material balance or other relevant process parameter monitoring, provided appropriate measurements of SRU efficiency are based on periodic (e.g. once every 2 years) plant performance tests.</p> <p>(7) Antimony (Sb) is monitored only in catalytic cracking units when Sb injection is used in the process (e.g. for metals passivation)</p> <p>(8) With the exception of combustion units firing only gaseous fuel</p>										
5	<p>BAT is to monitor the relevant process parameters linked to pollutant emissions, at catalytic cracking and combustion units by using appropriate techniques and with at least the frequency given below.</p> <table border="1" data-bbox="271 1257 1055 1430"> <thead> <tr> <th data-bbox="271 1257 663 1286">Description</th> <th data-bbox="663 1257 1055 1286">Minimum frequency</th> </tr> </thead> <tbody> <tr> <td data-bbox="271 1286 663 1398">Monitoring of parameters linked to pollution emissions, e.g. O₂ content in flue-gas, N and S content in fuel or feed ⁽¹⁾</td> <td data-bbox="663 1286 1055 1398">Continuous for O₂ content. For N and S content, periodic at a frequency based on significant fuel/feed changes.</td> </tr> </tbody> </table>				Description	Minimum frequency	Monitoring of parameters linked to pollution emissions, e.g. O ₂ content in flue-gas, N and S content in fuel or feed ⁽¹⁾	Continuous for O ₂ content. For N and S content, periodic at a frequency based on significant fuel/feed changes.	N/A	<p>We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.</p> <p>Note: Continuous O₂ (monitoring) is in place for emission point A1.</p> <p>S and liquid fuels are monitored. The majority of the sites combustion by natural gas.</p> <p>No Nitrogen monitoring performed. Plant fuel oil is monitored for Sulphur (3x per week) using IP336. This also includes all</p>	3.5.1
Description	Minimum frequency										
Monitoring of parameters linked to pollution emissions, e.g. O ₂ content in flue-gas, N and S content in fuel or feed ⁽¹⁾	Continuous for O ₂ content. For N and S content, periodic at a frequency based on significant fuel/feed changes.										

BAT Conclusion Number	Summary of BAT Conclusion requirement	Status NA/ CC / FC / NC	Assessment of the installation capability and any alternative techniques proposed by the operator to demonstrate compliance with the BAT Conclusion requirement	Relevant permit condition(s)				
	<div style="border: 1px solid black; padding: 5px;"> <p>(1) N and S monitoring in fuel or feed may not be necessary when continuous emission measurement of NO_x and SO₂ are carried out at the stack.</p> </div>		incoming fuel oils. All results are stored on a LIMS System. There is a requirement for periodic NO _x and SO _x monitoring in the current permit.					
6	<p>BAT is to monitor diffuse VOC emissions to air from the entire site by using all of the following techniques:</p> <ul style="list-style-type: none"> i. sniffing methods associated with correlation curves for key equipment; ii. optical gas imaging techniques; iii. calculations of chronic emissions based on emissions factors periodically (e.g. once every two years) validated by measurements. <p>The screening and quantification of site emissions by periodic campaigns with optical absorption-based-techniques, such as differential absorption light detection and ranging (DIAL) or solar occultation flux (SOF) is a useful complementary technique.</p> <p>Description. See section 1.20.6, Annex 1.</p>	FC	The operator does not currently use all three techniques so an improvement condition has been imposed requiring the operator to agree an appropriate programme.	IC3				
7	<p>In order to prevent or reduce emissions to air, BAT is to operate the acid gas removal units, sulphur recovery units and all other waste gas treatment systems with a high availability and at optimal capacity.</p> <p>Special procedures can be defined for other than normal operating conditions, in particular:</p> <ul style="list-style-type: none"> i. During start-up and shutdown operations. ii. during other circumstances that could affect the proper functioning of the systems (e.g. regular and extraordinary maintenance work and cleaning operations of the units and/or of the waste gas treatment system); iii. in case of insufficient waste gas flow or temperature which prevents the use of the waste gas treatment system at full capacity. 	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
8	<p>In order to prevent and reduce ammonia (NH₃) emissions to air when applying selective catalytic reduction (SCR) or selective non-catalytic reduction (SNCR) techniques, BAT is to maintain suitable operating conditions of the SCR or SNCR waste gas treatment systems, with the aim of limiting emissions of unreacted NH₃.</p> <p>Table 2 BAT- associated emission levels for ammonia (NH₃) emissions to air for a combustion process unit where SCR or SNCR techniques are used.</p> <table border="1" data-bbox="271 1366 1032 1453"> <thead> <tr> <th>Parameter</th> <th>BAT-AEL (monthly average mg/m³)</th> </tr> </thead> <tbody> <tr> <td>Ammonia expressed as NH₃</td> <td><5 - 15mg/Nm³ (1) (2)</td> </tr> </tbody> </table>	Parameter	BAT-AEL (monthly average mg/m ³)	Ammonia expressed as NH ₃	<5 - 15mg/Nm ³ (1) (2)	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.

Technique	Description	Applicability																										
i. Selection or treatment of fuel																												
(a) Use of gas to replace liquid fuel	Gas generally contains less nitrogen than liquid and its combustion leads to a lower level of NO _x emissions. See section 1.20.3, Annex 1.	The applicability may be limited by the constraints associated with the availability of low sulphur gas fuels, which may be impacted by the energy policy of the Member State																										
(b) Use of low nitrogen refinery fuel oil (RFO) e.g. by RFO selection or by hydrotreatment of RFO	Refinery fuel oil selection favours low nitrogen liquid fuels among the possible sources to be used at the unit. Hydrotreatment aims at reducing the sulphur, nitrogen and metal contents of the fuel. See section 1.20.3, Annex 1.	Applicability is limited by the availability of low nitrogen liquid fuels, hydrogen production and hydrogen sulphide (H ₂ S) treatment capacity (e.g. amine and Claus units)																										
ii. Combustion modifications																												
(a) Staged combustion: • air staging • fuel staging	See section 1.20.2, Annex 1.	Fuel staging for mixed or liquid firing may require a specific burner design																										
(b) Optimisation of combustion	See section 1.20.2, Annex 1.	Generally applicable																										
(c) Flue-gas recirculation	See section 1.20.2, Annex 1.	Applicable through the use of specific burners with internal recirculation of the flue-gas. The applicability may be restricted to retrofitting external flue-gas recirculation to units																										

BAT Conclusion Number	Summary of BAT Conclusion requirement			Status NA/ CC / FC / NC	Assessment of the installation capability and any alternative techniques proposed by the operator to demonstrate compliance with the BAT Conclusion requirement	Relevant permit condition(s)						
			with a forced/induced draught mode of operation									
	(d) Diluent injection	See section 1.20.2, Annex 1.	Applicable for gas turbines where appropriate inert diluents are available		N/A							
	(e) Use of low-NO _x burners (LNB)	See section 1.20.2, Annex 1.	Generally applicable for new units taking into account, the fuel-specific limitation (e.g. for heavy oil). For existing units, applicability may be restricted by the complexity caused by site-specific conditions e.g. furnaces design, surrounding devices. In very specific cases, substantial modifications may be required. The applicability may be restricted for furnaces in the delayed coking process, due to possible coke generation in the furnaces. In gas turbines, the applicability is restricted to low hydrogen content fuels (generally < 10 %)		Yes							
	II. Secondary or end-of-pipe techniques, such as:											
	<table border="1"> <thead> <tr> <th data-bbox="271 1270 528 1294">Technique</th> <th data-bbox="539 1270 770 1294">Description</th> <th data-bbox="781 1270 1043 1294">Applicability</th> </tr> </thead> <tbody> <tr> <td data-bbox="271 1302 528 1350">i. Parameter	BAT- AEL (monthly average) mg/Nm ³							
Carbon monoxide expressed as CO	≤ 100							
38	In order to reduce emissions to air from the etherification process, BAT is to ensure the appropriate treatment of process off-gases by routing them to the refinery fuel gas system.	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
39	In order to prevent upset of the biotreatment, BAT is to use a storage tank and an appropriate unit production plan management to control the toxic components dissolved content (e.g. methanol, formic acid, ethers) of the waste water stream prior to final treatment.	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
40	In order to reduce emissions to air of chlorinated compounds, BAT is to optimise the use of chlorinated organic compounds used to maintain catalyst activity when such a process is in place or to use non-chlorinated catalytic systems.	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
41	In order to reduce sulphur dioxide emissions to air from the natural gas plant, BAT is to apply BAT 54.	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
42	In order to reduce nitrogen oxides (NO_x) emissions to air from the natural gas plant, BAT is to apply BAT 34	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
43	In order to prevent emissions of mercury when present in raw natural gas, BAT is to remove the mercury and recover the mercury-containing sludge for waste disposal.	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.					
44	<p>In order to prevent or reduce waste water flow generation from the distillation process, BAT is to use liquid ring vacuum pumps or surface condensers.</p> <p>Applicability. May not be applicable in some retrofit cases. For new units, vacuum pumps, either in or not in combination with the steam ejectors, may be</p>	CC	Liquid ring pumps and condensers in place	2.3.1

	needed to achieve a high volume (10 mm Hg). Also, a spare should be available in case the vacuum pump fails.			
45	In order to prevent or reduce water pollution from the distillation process, BAT is to route sour water to the stripping unit.	N/A	N/A in bitumen refineries with <1 t/d sulphur compounds Note the pollution inventory submission verifies there are <1 t/d sulphur compounds.	2.3.1
46	In order to prevent or reduce emissions to air from distillation units, BAT is to ensure the appropriate treatment of process off-gases, especially incondensable off-gases, by acid gas removal prior to further use. Applicability. Generally applicable for crude and vacuum distillation units. May not be applicable for standalone lubricant and bitumen refineries, with emissions of less than 1 t/d of sulphur compounds. In specific refinery configurations, applicability may be restricted, due to the need for e.g. large piping, compressors or additional amine treating capacity.	N/A	N/A in bitumen refineries with <1 t/d sulphur compounds Note the pollution inventory submission verifies there are <1 t/d sulphur compounds.	
47	In order to reduce emissions to air from the products treatment process, BAT is to ensure the appropriate disposal of off-gases, especially odorous spent air from sweetening units, by routing them to destruction, e.g. by incineration. Applicability. Generally applicable to products treatment processes where the gas streams can be safely processed to the destruction units. May not be applicable to sweetening units, due to safety reasons.	CC	Process off gases are combusted either in the main process unit furnaces or the incinerator.	2.3.1
48	In order to reduce waste and waste water generation when a products treatment process using caustic is in place, BAT is to use cascading caustic solution and a global management of spent caustic, including recycling after appropriate treatment, e.g. by stripping.	N/A	We agree this BAT Conclusion is not applicable to the relevant activities carried out at this installation.	2.3.1
49	In order to reduce VOC emissions to air from the storage of volatile liquid hydrocarbon compounds, BAT is to use floating roof storage tanks equipped with high efficiency seals or a fixed roof tank connected to a vapour recovery system. Description. High efficiency seals are specific devices for limiting losses of vapour e.g. improved primary seals, additional multiple (secondary or tertiary) seals (according to quantity emitted). Applicability. The applicability of high efficiency seals may be restricted for retrofitting tertiary seals in existing tanks.	CC	Floating roof and high efficiency seals in place on naphtha tanks.	2.3.1
50	In order to reduce VOC emissions to air from the storage of volatile liquid hydrocarbon compounds, BAT is to use one or a combination of the techniques given below.	CC		2.3.1

It also includes a system response to spill consequences to act	Generally applicable	CC	<p>Tank inspection program in place; all oil bunds have 110% volume of the largest tank or 25% of the aggregate tank capacity, whichever is largest. Eastham Tank farm lined with concrete; clay layer acts as secondary barrier on the main site</p> <p>Tanks are routinely inspected to relevant standard, tanks have radar gauges with readout and alarms in manned control room; secondary level devices in place; plant reconciliation performed twice a week.</p>	1.1 2.3.1 3.2.3			
Technique	Description	Applicability													
i. Maintenance programme including corrosion monitoring, prevention and control	A management system including leak detection and operational controls to prevent overfilling, inventory control and risk-based inspection procedures on tanks at intervals to prove their integrity, and maintenance to improve tank containment. It also includes a system response to spill consequences to act	Generally applicable													

BAT Conclusion Number	Summary of BAT Conclusion requirement			Status NA/ CC / FC / NC	Assessment of the installation capability and any alternative techniques proposed by the operator to demonstrate compliance with the BAT Conclusion requirement	Relevant permit condition(s)
		before spills can reach the groundwater. To be especially reinforced during maintenance periods			No No	
ii. Double bottomed tanks	A second impervious bottom that provides a measure of protection against releases from the first material	Generally applicable for new tanks and after an overhaul of existing tanks (1)				
iii. Impervious membrane liners	A continuous leak barrier under the entire bottom surface of the tank	Generally applicable for new tanks and after an overhaul of existing tanks (1)				
iv. Sufficient tank farm bund containment	A tank farm bund is designed to contain large spills potentially caused by a shell rupture or overfilling (for both environmental and safety reasons). Size and associated building rules are generally defined by local regulations	Generally applicable				
(1) Techniques ii and iii may be generally applicable where tanks are dedicated to products that require heat for liquid handling (e.g. bitumen) and where no leak is likely because of solidification						
52	In order to prevent or reduce VOC emissions to air from loading and unloading operations of volatile liquid hydrocarbon compounds, BAT is to use one or a combination of the techniques given below to achieve a recovery rate of at least 95 %.			N/A	With the exception of the naphtha, the crude oil, bitumen and gas oils have low vapour pressures and therefore this BAT conclusion does not apply to them. Naphtha is the only material that is handled that is classified as a volatile liquid hydrocarbon (i.e. a material with a RVP > 4kPa). Naphtha is produced from the refinery process and is exported in bulk from the refinery via a pipeline on to ship(s). < 10kt/year and therefore <1 million m ³ /yr therefore, this is below the threshold that applies to loading and unloading operations and therefore Eastham do not meet the applicability criteria required by BAT 52	2.3.1
Technique		Description	Applicability			
Vapour recovery by: i. Condensation ii. Absorption iii. Adsorption		See section 1.20.6, Annex 1.	Generally applicable to loading/unloading operations where annual throughput is

	<p>BAT for monitoring emissions of SO₂ under an integrated emission management approach is as in BAT 4, complemented with the following:</p> <ul style="list-style-type: none"> • a monitoring plan including a description of the processes monitored, a list of the emission sources and source streams (products, waste gases) monitored for each process and a description of the methodology (calculations, measurements) used and the underlying assumptions and associated level of confidence; • continuous monitoring of the flue-gas flow rates of the units concerned, either through direct measurement or by an equivalent method; • a data management system for collecting, processing and reporting all monitoring data needed to determine the emissions from the sources covered by the integrated emission management technique 			

6 Emissions to Water

The consolidated permit incorporates the two current discharges to controlled waters identified as W1 and W2. These relate to the discharge from the water softening plant and surface water run off to the Manchester Ship Canal respectively. There have been and there are no current plans to change the quantity or components of these discharges as a result of complying with the BAT conclusions. This Permit review against the BAT Conclusions for the Refining of Mineral Oil and Gas has not identified any additional monitoring and compliance requirements. The monitoring requirements and limits of the existing permit have been retained.

There are also emissions to sewer which discharges process effluents to a third party sewage treatment works via S1. There have been and there are no current plans to change the quantity or components of these discharges as a result of complying with the BAT conclusions. This Permit review against the BAT Conclusions for the Refining of Mineral Oil and Gas has not identified any additional monitoring and compliance requirements.

However compliance with the requirements of BATc 12 cannot be adequately demonstrated by the Operator. Improvement Conditions 4 & 5 have been added to Table S1.3 Improvement Programme Requirements to address this. Details of the Improvement Conditions are included in Annex 2 below.

In addition to the review of compliance against the relevant BATc for emissions to water, this Permit review also provides an opportunity to consider whether the discharge to sewer will maintain River Quality Objectives (RQOs) in the receiving watercourse to ensure the water quality objectives under Water Framework Directive will be met.

The Operator does not currently have sufficient information for this assessment to be made. Improvement Conditions 4 & 6 have been added to Table S1.3 Improvement Programme Requirements to address this. Details of the Improvement Conditions are included in Annex 2 below.

7 Additional IED Chapter II requirements:

Condition 3.1.3 relating to protection of soil, groundwater and groundwater monitoring, has been retained in compliance with IED requirements. Conditions 4.3.1 has been amended to reflect the current permit template and condition 4.3.2 relating to notifications have been retained in compliance with IED requirements.

8 Review and assessment of changes that are not part of the BAT Conclusions derived permit review.

This document should be read in conjunction with the application, supporting information and permit/notice.

Aspect considered	Justification / Detail
Confidential information	A claim for commercial or industrial confidentiality has not been made.
Identifying confidential information	We have not identified information provided as part of the response to the Regulation 60 Notice that we consider to be confidential. The decision was taken in accordance with our guidance on commercial confidentiality.
Scope of consultation	The consultation requirements were reviewed and did not need to be implemented. The decision was taken in accordance with the Environmental Permitting Regulations and our public participation statement.
Control of the facility	We are satisfied that the operator is the person who will have control over the operation of the facility after the issue of the consolidation. The decision was taken in accordance with our guidance on legal operator for environmental permits.
Applicable directives	All applicable European directives have been considered in the determination of the application.
Extent of the site of the facility	<p>The operator has provided a plan which we consider is satisfactory, showing the extent of the site of the facility.</p> <p>A plan is included in the permit and the operator is required to carry on the permitted activities within the site boundary.</p>
Site condition report	<p>The operator has provided a description of the condition of the site.</p> <p>We consider this description is satisfactory. The decision was taken in accordance with our guidance on site condition reports and baseline reporting under IED– guidance and templates (H5).</p>

Aspect considered	Justification / Detail
Biodiversity, Heritage, Landscape and Nature Conservation	<p>The Installation is within the relevant distance criteria of a site of heritage, landscape or nature conservation, and/or protected species or habitat.</p> <p>A full assessment of the application and its potential to affect the site(s)/species/habitat has not been carried out as part of the permitting process. We consider that the review will not affect the features of the site/species/habitat.</p>
Operating techniques	<p>We have reviewed the techniques, where relevant to the BAT Conclusions, used by the operator and compared these with the relevant guidance notes.</p> <p>We consider that the emission limits included in the installation permit reflect the BAT for the sector.</p>
Updating permit conditions during consolidation.	<p>We have updated previous permit conditions to those in the new generic permit template as part of permit consolidation. The new conditions have the same meaning as those in the previous permit(s). Reporting form E1 has been updated to reflect the change to using natural gas as a fuel.</p> <p>The operator has agreed that the new conditions are acceptable.</p>
Use of conditions other than those from the template	<p>Based on the information in the application, we consider that we do not need to impose conditions other than those in our permit template, which was developed in consultation with industry having regard to the relevant legislation.</p>
Raw materials	<p>We have retained the specified limits and controls on the use of raw materials and fuels.</p>
Pre-operational conditions	<p>Not Applicable</p>
Improvement conditions	<p>Based on the information on the application, we consider that we need to impose improvement conditions.</p> <p>We have imposed improvement conditions to ensure that:</p> <ul style="list-style-type: none"> • The Operator submits a VOC monitoring plan to the Environment Agency for written approval (to ensure compliance with BAT conclusion 6).

Aspect considered	Justification / Detail
	<ul style="list-style-type: none"> • The Operator undertakes an assessment of the effectiveness of the treatment of their effluent at the United Utilities treatment works and compare this with the effectiveness of onsite treatment using biological treatment and clarification (to ensure compliance with BAT conclusion 12). • The Operator submits a surface water risk assessment report that investigates and reviews the emissions of effluent from Emission Point S1 to the receiving water body following the treatment of their effluent at the United Utilities treatment works (to assess the impact under the WFD). • The Operator carries out an assessment of the options available for segregation of water streams (to ensure compliance with BAT 11)
Incorporating the application	<p>We have specified that the applicant must operate the permit in accordance with descriptions in the application, including all additional information received as part of the determination process.</p> <p>These descriptions are specified in the Operating Techniques table in the permit.</p>
Emission limits	<p>We have decided that no additional emission limits should be set in the varied permit.</p> <p>Responses to IC5 will determine whether further limits will need to be incorporated into the permit.</p>
Monitoring	<p>We have decided that monitoring should be carried out for the parameters listed in the permit, using the methods detailed and to the frequencies specified.</p>
Reporting	<p>We have specified reporting in the permit.</p> <p>The reporting frequencies reflect that of the permit before it was varied.</p>
Management system	<p>There is no known reason to consider that the operator will not have the management system to enable it to comply with the permit conditions.</p> <p>The decision was taken in accordance with the guidance on operator competence and how to develop a management system for environmental permits.</p>
Section 108 Deregulation	<p>We have considered our duty to have regard to the desirability of promoting economic growth set out in section 108(1) of the Deregulation Act 2015 and the guidance</p>

Aspect considered	Justification / Detail
Act 2015 – Growth duty	<p>issued under section 110 of that Act in deciding whether to grant this permit.</p> <p>Paragraph 1.3 of the guidance says: “The primary role of regulators, in delivering regulation, is to achieve the regulatory outcomes for which they are responsible. For a number of regulators, these regulatory outcomes include an explicit reference to development or growth. The growth duty establishes economic growth as a factor that all specified regulators should have regard to, alongside the delivery of the protections set out in the relevant legislation.”</p> <p>We have addressed the legislative requirements and environmental standards to be set for this operation in the body of the decision document above. The guidance is clear at paragraph 1.5 that the growth duty does not legitimise non-compliance and its purpose is not to achieve or pursue economic growth at the expense of necessary protections.</p> <p>We consider the requirements and standards we have set in this permit are reasonable and necessary to avoid a risk of an unacceptable level of pollution. This also promotes growth amongst legitimate operators because the standards applied to the operator are consistent across businesses in this sector and have been set to achieve the required legislative standards.</p>

Annex 1: BAT conclusions for the Refining of Mineral Oil and Gas.

BAT conclusions for the Refining of Mineral Oil and Gas - Glossary

1.20 Description of techniques for the prevention and control of emissions to air.

1.20.1 Dust

Technique	Description
Electrostatic precipitator (ESP)	Electrostatic precipitators operate such that particles are charged and separated under the influence of an electrical field. Electrostatic precipitators are capable of operating under a wide range of conditions. Abatement efficiency may depend on the number of fields, residence time (size), catalyst properties and upstream particles removal devices. At FCC units, 3-field ESPs and 4-field ESPs are commonly used. ESPs may be used on a dry mode or with ammonia injection to improve the particle collection. For the calcining of green coke, the ESP capture efficiency may be reduced due to the difficulty for coke particles to be electrically charged
Multistage cyclone separators	Cyclonic collection device or system installed following the two stages of cyclones. Generally known as a third stage separator, common configuration consists of a single vessel containing many conventional cyclones or improved swirl-tube technology. For FCC, performance mainly depends on the particle concentration and size distribution of the catalyst fines downstream of the regenerator internal cyclones
Centrifugal washers	Centrifugal washers combine the cyclone principle and an intensive contact with water e.g. venturi washer
Third stage blowback filter	Reverse flow (blowback) ceramic or sintered metal filters where, after retention at the surface as a cake, the solids are dislodged by initiating a reverse flow. The dislodged solids are then purged from the filter system

1.20.2. Nitrogen oxides (NO_x)

Technique	Description
Combustion modifications	
Staged combustion	<ul style="list-style-type: none"> - Air staging — involves substoichiometric firing in a first step and the subsequent addition of the remaining air or oxygen into the furnace to complete combustion - Fuel staging — a low impulse primary flame is developed in the port neck; a secondary flame covers the root of the primary flame reducing its core temperature
Flue-gas recirculation	Reinjection of waste gas from the furnace into the flame to reduce the oxygen content and therefore the temperature of the flame. Special burners using the internal recirculation of combustion gases to cool the root of the flames and reduce the oxygen content in the hottest part of the flames
Use of low-NO _x burners (LNB)	The technique (including ultra-low-NO _x burners) is based on the principles of reducing peak flame temperatures, delaying but completing the combustion and increasing the heat transfer (increased emissivity of the flame). It may be associated with a

	modified design of the furnace combustion chamber. The design of ultra-low-NOX burners (ULNB) includes combustion staging (air/fuel) and flue-gas recirculation. Dry low-NO _x burners (DLNB) are used for gas turbines
Optimisation of combustion	Based on permanent monitoring of appropriate combustion parameters (e.g. O ₂ , CO content, fuel to air (or oxygen) ratio, unburnt components), the technique uses control technology for achieving the best combustion conditions
Diluent injection	Inert diluents, e.g. flue-gas, steam, water, nitrogen added to combustion equipment reduce the flame temperature and consequently the concentration of NO _x in the flue-gases
Selective catalytic reduction (SCR)	The technique is based on the reduction of NO _x to nitrogen in a catalytic bed by reaction with ammonia (in general aqueous solution) at an optimum operating temperature of around 300-450 °C. One or two layers of catalyst may be applied. A higher NO _x reduction is achieved with the use of higher amounts of catalyst (two layers)
Selective non-catalytic reduction (SNCR)	The technique is based on the reduction of NO _x to nitrogen by reaction with ammonia or urea at a high temperature. The operating temperature window must be maintained between 900 °C and 1 050 °C for optimal reaction
Low temperature NO _x oxidation	The low temperature oxidation process injects ozone into a flue-gas stream at optimal temperatures below 150 °C, to oxidise insoluble NO and NO ₂ to highly soluble N ₂ O ₅ . The N ₂ O ₅ is removed in a wet scrubber by forming dilute nitric acid waste water that can be used in plant processes or neutralised for release and may need additional nitrogen removal

1.20.3. Sulphur oxides (SO_x)

Technique	Description
Treatment of refinery fuel gas (RFG)	Some refinery fuel gases may be sulphur-free at source (e.g. from catalytic reforming and isomerisation processes) but most other processes produce sulphur-containing gases (e.g. off-gases from the visbreaker, hydrotreater or catalytic cracking units). These gas streams require an appropriate treatment for gas desulphurisation (e.g. by acid gas removal — see below — to remove H ₂ S) before being released to the refinery fuel gas system
Refinery fuel oil (RFO)	desulphurisation by hydrotreatment In addition to selection of low-sulphur crude, fuel desulphurisation is achieved by the hydrotreatment process (see below) where hydrogenation reactions take place and lead to a reduction in sulphur content
Use of gas to replace liquid fuel	Decrease the use of liquid refinery fuel (generally heavy fuel oil containing sulphur, nitrogen, metals, etc.) by replacing it with on-site Liquefied Petroleum Gas (LPG) or refinery fuel gas (RFG) or by externally supplied gaseous fuel (e.g. natural gas) with a low level of sulphur and other undesirable substances. At the individual combustion unit level, under multi-fuel firing, a minimum level of liquid firing is necessary to ensure flame stability
Use of SO _x reducing	Use of a substance (e.g. metallic oxides catalyst) that transfers the sulphur associated with coke from the regenerator back to the reactor. It operates most efficiently in full combustion mode rather

catalysts additives	than in deep partial-combustion mode. NB: SO _x reducing catalysts additives might have a detrimental effect on dust emissions by increasing catalyst losses due to attrition, and on NO _x emissions by participating in CO promotion, together with the oxidation of SO ₂ to SO ₃
Hydrotreatment	Based on hydrogenation reactions, hydrotreatment aims mainly at producing low-sulphur fuels (e.g. 10 ppm gasoline and diesel) and optimising the process configuration (heavy residue conversion and middle distillate production). It reduces the sulphur, nitrogen and metal content of the feed. As hydrogen is required, sufficient production capacity is needed. As the technique transfer sulphur from the feed to hydrogen sulphide (H ₂ S) in the process gas, treatment capacity (e.g. amine and Claus units) is also a possible bottleneck
Acid gas removal e.g. by amine treating	Separation of acid gas (mainly hydrogen sulphide) from the fuel gases by dissolving it in a chemical solvent (absorption). The commonly used solvents are amines. This is generally the first step treatment needed before elemental sulphur can be recovered in the SRU
Sulphur recovery unit (SRU)	Specific unit that generally consists of a Claus process for sulphur removal of hydrogen sulphide (H ₂ S)-rich gas streams from amine treating units and sour water strippers. SRU is generally followed by a tail gas treatment unit (TGTU) for remaining H ₂ S removal
Tail gas treatment unit (TGTU)	A family of techniques, additional to the SRU in order to enhance the removal of sulphur compounds. They can be divided into four categories according to the principles applied: <ul style="list-style-type: none"> - direct oxidation to sulphur - continuation of the Claus reaction (sub-dewpoint conditions) - oxidation to SO₂ and recovering sulphur from SO₂ - reduction to H₂S and recovery of sulphur from this H₂S (e.g. amine process)
Wet scrubbing	In the wet scrubbing process, gaseous compounds are dissolved in a suitable liquid (water or alkaline solution). Simultaneous removal of solid and gaseous compounds may be achieved. Downstream of the wet scrubber, the flue-gases are saturated with water and a separation of the droplets is required before discharging the flue-gases. The resulting liquid has to be treated by a waste water process and the insoluble matter is collected by sedimentation or filtration According to the type of scrubbing solution, it can be: <ul style="list-style-type: none"> - a non-regenerative technique (e.g. sodium or magnesium-based) - a regenerative technique (e.g. amine or soda solution) According to the contact method, the various techniques may require e.g.: <ul style="list-style-type: none"> - Venturi using the energy from inlet gas by spraying it with the liquid - packed towers, plate towers, spray chambers.

	Where scrubbers are mainly intended for SO _x removal, a suitable design is needed to also efficiently remove dust. The typical indicative SO _x removal efficiency is in the range 85-98 %.
Non-regenerative scrubbing	Sodium or magnesium-based solution is used as alkaline reagent to absorb SO _x generally as sulphates. Techniques are based on e.g.: — wet limestone — aqueous ammonia — seawater (see infra)
Seawater scrubbing	A specific type of non-regenerative scrubbing using the alkalinity of the seawater as solvent. Generally requires an upstream abatement of dust
Regenerative scrubbing	Use of specific SO _x absorbing reagent (e.g. absorbing solution) that generally enables the recovery of sulphur as a by-product during a regenerating cycle where the reagent is reused

1.20.4. Combined techniques (SO_x, NO_x and dust)

Technique	Description
Wet scrubbing	See Section 1.20.3
SNO _x combined technique	Combined technique to remove SO _x , NO _x and dust where a first dust removal stage (ESP) takes place followed by some specific catalytic processes. The sulphur compounds are recovered as commercial-grade concentrated sulphuric acid, while NO _x is reduced to N ₂ . Overall SO _x removal is in the range: 94-96,6 %. Overall NO _x removal is in the range: 87-90 %

1.20.5. Carbon monoxide (CO) Technique

Technique	Description
Combustion operation control	The increase in CO emissions due to the application of combustion modifications (primary techniques) for the reduction of NO _x emissions can be limited by a careful control of the operational parameters
Catalysts with carbon monoxide (CO) oxidation promoters	Use of a substance which selectively promotes the oxidation of CO into CO ₂ (combustion)
Carbon monoxide (CO) boiler	Specific post-combustion device where CO present in the flue-gas is consumed downstream of the catalyst regenerator to recover the energy It is usually used only with partial-combustion FCC units

1.20.6. Volatile organic compounds (VOC)

Technique	Description
Vapour recovery	Volatile organic compounds emissions from loading and unloading operations of most volatile products, especially crude oil and lighter products, can be abated by various techniques e.g.: – Absorption: the vapour molecules dissolve in a suitable absorption liquid (e.g. glycols or mineral oil fractions such as

	<p>kerosene or reformat). The loaded scrubbing solution is desorbed by reheating in a further step. The desorbed gases must either be condensed, further processed, and incinerated or re-absorbed in an appropriate stream (e.g. of the product being recovered)</p> <ul style="list-style-type: none"> - Adsorption: the vapour molecules are retained by activate sites on the surface of adsorbent solid materials, e.g. activated carbon (AC) or zeolite. The adsorbent is periodically regenerated. The resulting desorbate is then absorbed in a circulating stream of the product being recovered in a downstream wash column. Residual gas from wash column is sent to further treatment - Membrane gas separation: the vapour molecules are processed through selective membranes to separate the vapour/air mixture into a hydrocarbon- enriched phase (permeate), which is subsequently condensed or absorbed, and a hydrocarbon-depleted phase (retentate). - Two-stage refrigeration/condensation: by cooling of the vapour/gas mixture the vapour molecules condense and are separated as a liquid. As the humidity leads to the icing-up of the heat exchanger, a two-stage condensation process providing for alternate operation is required. - Hybrid systems: combinations of available techniques <p><i>NB</i> Absorption and adsorption processes cannot notably reduce methane emissions</p>
Vapour destruction	<p>Destruction of VOCs can be achieved through e.g. thermal oxidation (incineration) or catalytic oxidation when recovery is not easily feasible. Safety requirements (e.g. flame arrestors) are needed to prevent explosion.</p> <p>Thermal oxidation occurs typically in single chamber, refractory-lined oxidisers equipped with gas burner and a stack. If gasoline is present, heat exchanger efficiency is limited and preheat temperatures are maintained below 180 °C to reduce ignition risk. Operating temperatures range from 760 °C to 870 °C and residence times are typically 1 second. When a specific incinerator is not available for this purpose, an existing furnace may be used to provide the required temperature and residence times.</p> <p>Catalytic oxidation requires a catalyst to accelerate the rate of oxidation by adsorbing the oxygen and the VOCs on its surface The catalyst enables the oxidation reaction to occur at lower temperature than required by thermal oxidation: typically ranging from 320 °C to 540 °C. A first preheating step (electrically or with gas) takes place to reach a temperature necessary to initiate the VOCs catalytic oxidation. An oxidation step occurs when the air is passed through a bed of solid catalysts</p>
LDAR (leak detection and repair) programme	<p>An LDAR (leak detection and repair) programme is a structured approach to reduce fugitive VOC emissions by detection and subsequent repair or replacement of leaking components.</p>

	<p>Currently, sniffing (described by EN 15446) and optical gas imaging methods are available for the identification of the leaks.</p> <p>Sniffing method: The first step is the detection using hand-held VOC analysers measuring the concentration adjacent to the equipment (e.g. by using flame ionisation or photo-ionisation). The second step consists of bagging the component to carry out a direct measurement at the source of emission. This second step is sometimes replaced by mathematical correlation curves derived from statistical results obtained from a large number of previous measurements made on similar components.</p> <p>Optical gas imaging methods: Optical imaging uses small lightweight hand- held cameras which enable the visualisation of gas leaks in real time, so that they appear as 'smoke' on a video recorder together with the normal image of the component concerned to easily and rapidly locate significant VOC leaks. Active systems produce an image with a back-scattered infrared laser light reflected on the component and its surroundings. Passive systems are based on the natural infrared radiation of the equipment and its surroundings</p>
VOC diffuse emissions monitoring	<p>Full screening and quantification of site emissions can be undertaken with an appropriate combination of complementary methods, e.g. Solar occultation flux (SOF) or differential absorption lidar (DIAL) campaigns. These results can be used for trend evaluation in time, cross checking and updating/validation of the ongoing LDAR programme.</p> <p>Solar occultation flux (SOF): The technique is based on the recording and spectrometric Fourier Transform analysis of a broadband infrared or ultraviolet/ visible sunlight spectrum along a given geographical itinerary, crossing the wind direction and cutting through VOC plumes.</p> <p>Differential absorption LIDAR (DIAL): DIAL is a laser-based technique using differential adsorption LIDAR (light detection and ranging) which is the optical analogue of sonic radio wave-based RADAR. The technique relies on the back- scattering of laser beam pulses by atmospheric aerosols, and the analysis of spectral properties of the returned light collected with a telescope</p>
High-integrity equipment	<p>High-integrity equipment includes e.g.:</p> <ul style="list-style-type: none"> - valves with double packing seals - magnetically driven pumps/compressors/agitators - pumps/compressors/agitators fitted with mechanical seals instead of packing - high-integrity gaskets (such as spiral wound, ring joints) for critical applications

1.20.7. Other techniques

Techniques to prevent or reduce emissions from flaring	<p>Correct plant design: includes sufficient flare gas recovery system capacity, the use of high-integrity relief valves and other measures to use flaring only as a safety system for other than normal operations (start-up, shutdown, emergency).</p>
--	---

	<p>Plant management: includes organisational and control measures to reduce flaring events by balancing RFG system, using advanced process control, etc.</p> <p>Flaring devices design: includes height, pressure, assistance by steam, air or gas, type of flare tips, etc. It aims at enabling smokeless and reliable operations and ensuring an efficient combustion of excess gases when flaring from non- routine operations.</p> <p>Monitoring and reporting: Continuous monitoring (measurements of gas flow and estimations of other parameters) of gas sent to flaring and associated parameters of combustion (e.g. flow gas mixture and heat content, ratio of assistance, velocity, purge gas flow rate, pollutant emissions). Reporting of flaring events makes it possible to use flaring ratio as a requirement included in the EMS and to prevent future events. Visual remote monitoring of the flare can also be carried out by using colour TV monitors during flare events</p>
Choice of the catalyst promoter to avoid dioxins formation	During the regeneration of the reformer catalyst, organic chloride is generally needed for effective reforming catalyst performance (to re-establish the proper chloride balance in the catalyst and to assure the correct dispersion of the metals). The choice of the appropriate chlorinated compound will have an influence on the possibility of emissions of dioxins and furans
Solvent recovery for base oil production processes	<p>The solvent recovery unit consists of a distillation step where the solvents are recovered from the oil stream and a stripping step (with steam or an inert gas) in a fractionator.</p> <p>The solvents used may be a mixture (DiMe) of 1,2-dichloroethane (DCE) and dichloromethane (DCM).</p> <p>In wax-processing units, solvent recovery (e.g. for DCE) is carried out using two systems: one for the deoiled wax and another one for the soft wax. Both consist of heat-integrated flashdrums and a vacuum stripper. Streams from the dewaxed oil and waxes product are stripped for removal of traces of solvents</p>

1.21. Description of techniques for the prevention and control of emissions to water

1.21.1. Waste water pretreatment

Pretreatment of sour water streams before reuse or treatment	Send generated sour water (e.g. from distillation, cracking, coking units) to appropriate pretreatment (e.g. stripper unit)
Pretreatment of other waste water streams prior to treatment	To maintain treatment performance, appropriate pretreatment may be required

1.21.2. Waste water treatment

Removal of insoluble substances by recovering oil	<p>These techniques generally include:</p> <ul style="list-style-type: none"> - API Separators (APIs) - Corrugated Plate Interceptors (CPIs) - Parallel Plate Interceptors (PPIs) - Tilted Plate Interceptors (TPIs)
---	--

	<ul style="list-style-type: none"> - Buffer and/or equalisation tanks
Removal of insoluble substances by recovering suspended solid and dispersed oil	<p>These techniques generally include:</p> <ul style="list-style-type: none"> - Dissolved Gas Flotation (DGF) - Induced Gas Flotation (IGF) - Sand Filtration
Removal of soluble substances including biological treatment and clarification	<p>Biological treatment techniques may include:</p> <ul style="list-style-type: none"> - Fixed bed systems - Suspended bed systems. <p>One of the most commonly used suspended bed system in refineries WWTP is the activated sludge process. Fixed bed systems may include a biofilter or trickling filter</p>
Additional treatment step	<p>A specific waste water treatment intended to complement the previous treatment steps e.g. for further reducing nitrogen or carbon compounds. Generally used where specific local requirements for water preservation exist.</p>

Annex 2: Improvement Conditions

Based in the information in the Operators Regulation 60 Notice responses and our own records of the capability and performance of the installation at this site, we consider that we need to set improvement conditions so that the outcome of the techniques detailed in the BAT Conclusions are achieved by the installation. These additional improvement conditions are set out below - justifications for them are provided at the relevant section of the decision document.

Table S1.3 Improvement programme requirements		
Reference	Requirement	Date
IC3	<p>The Operator shall submit a diffuse VOC monitoring plan to the Environment Agency for written approval. This shall include but not be limited to:</p> <ul style="list-style-type: none"> • The nature of the material handled; • The sources of emissions; • Justification of the monitoring techniques selected • How the monitoring data will be recorded and reviewed <p>The plan shall take into account the appropriate techniques for VOC monitoring specified in BAT conclusion 6 for the Refining of Mineral Oil and Gas. The Operator shall implement the approved plan and produce and submit an annual report on the results of the monitoring undertaken under the plan.</p>	30/11/2017
IC4	<p>The operator shall submit a written monitoring plan to the Environment Agency for approval that includes proposals to undertake representative monitoring of the parameters of</p> <ol style="list-style-type: none"> a) hazardous pollutants (as set out in the Environment Agency's Surface Water Pollution Risk Assessment guidance; and b) the "BAT Conclusions for the Refining of Mineral Oil and Gas" BAT Conclusion 12 Table 3) in the discharge to sewer from point S1. The plan shall include the parameters to be monitored, frequencies of monitoring and methods to be used; <p>The operator shall carry out the monitoring in accordance with the Environment Agency's written approval.</p>	28/02/2018
IC5	<p>The operator shall submit a written report to the Environment Agency for approval that includes:</p> <ol style="list-style-type: none"> a) results of an assessment of the impact of the emissions to surface water from the site for the parameters listed in "BAT Conclusions for the Refining of Mineral Oil and Gas" BAT Conclusion 12 Table 3 following the treatment of the effluent at the United Utilities treatment works in accordance with the Environment Agency's Surface Water Pollution Risk Assessment Guidance available on our website <p>demonstration that the discharging of waste water to sewer for treatment is equivalent to the technique given in BAT 12 and that this treatment achieves the BAT-associated emission levels set out in BAT Conclusion Table 3.</p>	31/03/2018

Table S1.3 Improvement programme requirements		
Reference	Requirement	Date
IC6	<p>The operator shall submit a written report to the Environment Agency for approval that includes:</p> <p>the results of an assessment of the impact of the emissions to surface water from the site following the treatment of the effluent at the United Utilities treatment works in accordance with the Environment Agency's Surface Water Pollution Risk Assessment Guidance available on our website. The report shall:</p> <p>(a) be based on the parameters monitored in IC4(a) above; and</p> <p>Include proposals for appropriate measures to mitigate the impact of any emissions where the assessment determines they are liable to cause pollution, including timescales for implementation of individual measures.</p>	30/09/2018
IC7	<p>The Operator shall carry out an assessment of the options available for segregation of water streams to reduce the volume of process water produced, as detailed in BAT conclusion 11 for the Refining of Mineral Oil and Gas.</p> <p>A written report summarising the findings shall be submitted to the Agency for approval, along with a timetable for implementing improvements. The Operator shall implement the improvements to the approved timetable.</p>	31/03/2018
