

# The Colour Assessment and Diagnosis (CAD) test and how it works

Dr Adrian Chorley MSc, PhD, FCOptom  
Optometrist Principal and Director  
Aviation Vision Services

# Plan

- Principles behind CAD test design
- What it measures and how
- Testing protocol
- Demonstration of CAD test

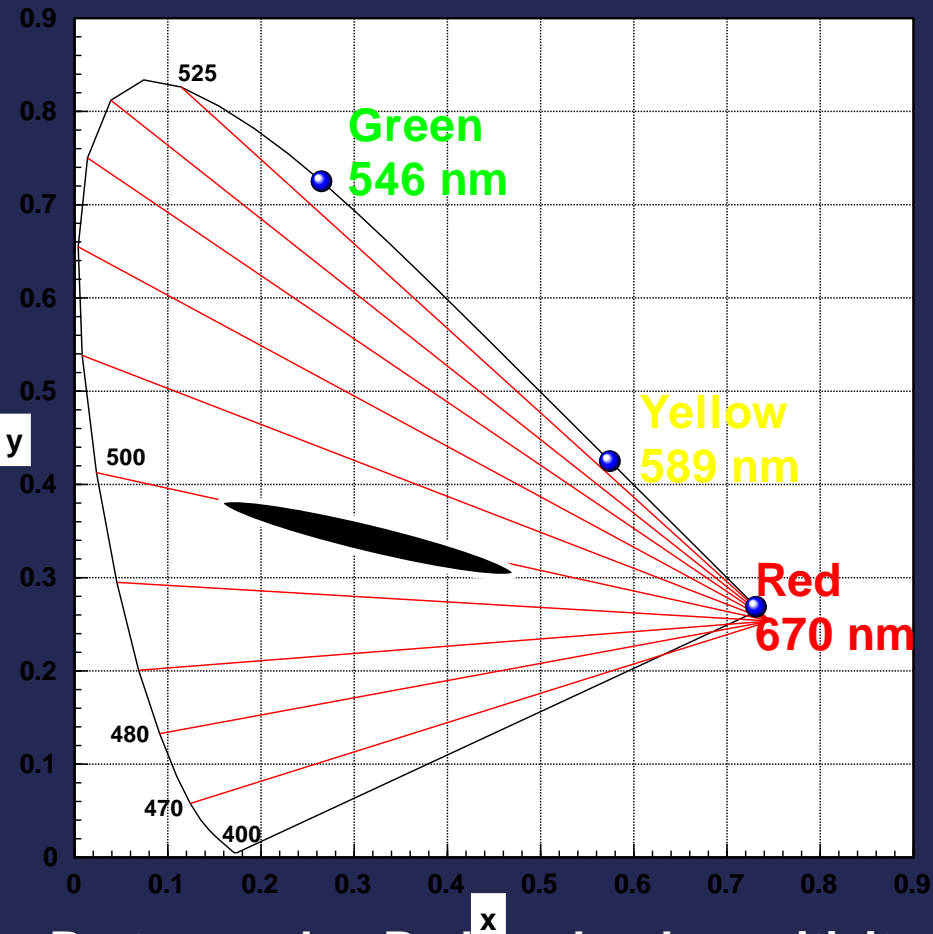

# Terminology

- Normal Trichromat
- Anomalous Trichromatism
  - Protanomaly or protanomalous trichromat (red deficiency)
  - Deuteranomaly or deuteranomalous trichromat (green deficiency)
  - Tritanomaly or tritanomalous trichromat (blue deficiency)
- Dichromat
  - Protanope, deuteranope, tritanope

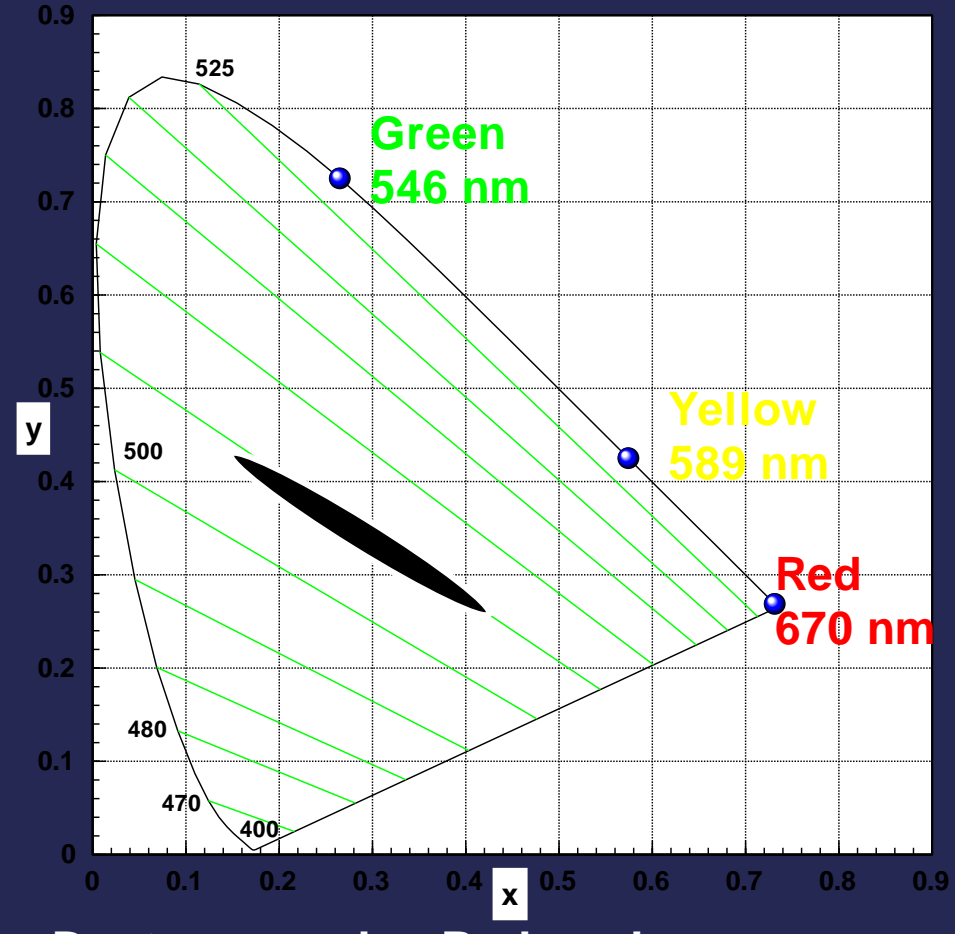

# CIE (Commission Internationale de L'Eclairage) 1931 x,y chromaticity diagram

# Dichromatic confusion lines

Protanomaly - Reduced red sensitivity

Deuteranomaly - Reduced green sensitivity

Both - Reduced red/green discrimination

# Normal

# Protanomaly

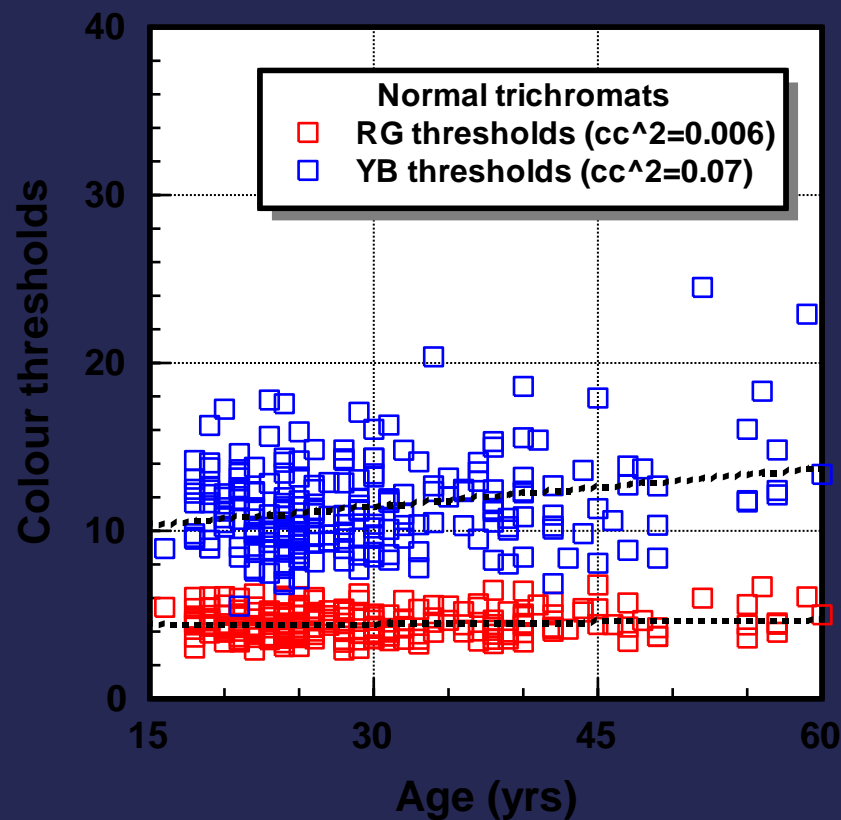

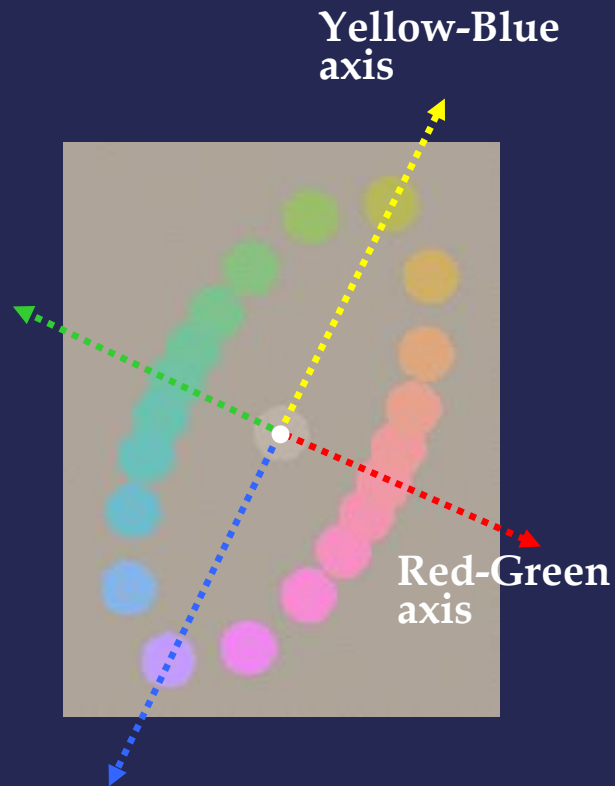

# Deuteranomaly

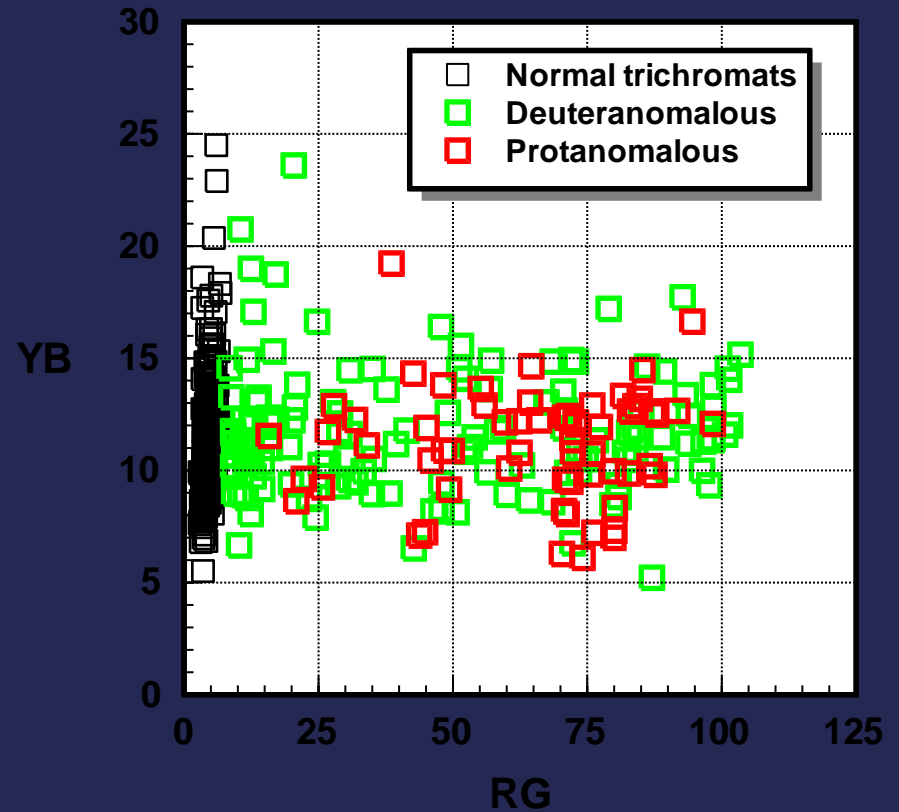

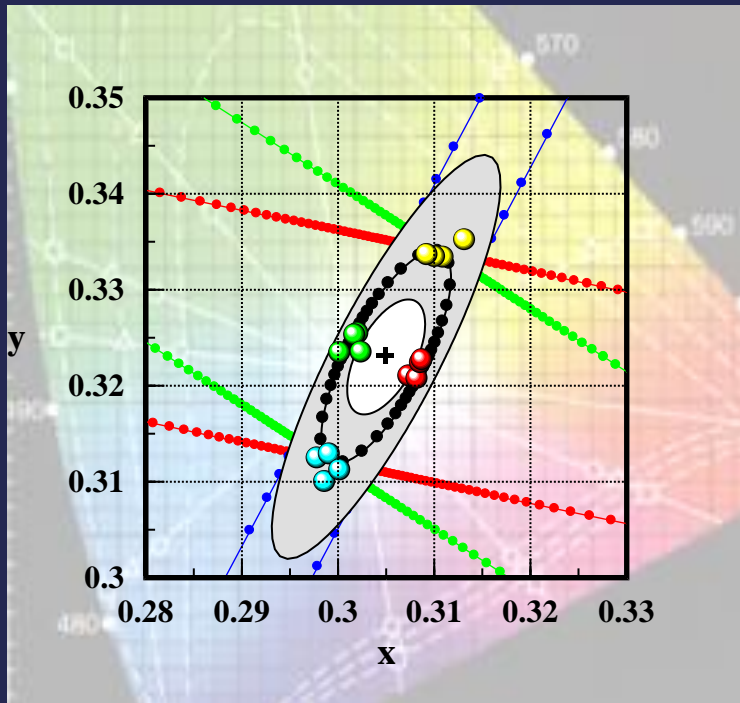

# MEASUREMENT OF COLOUR DISCRIMINATION

## The "Normal" subject

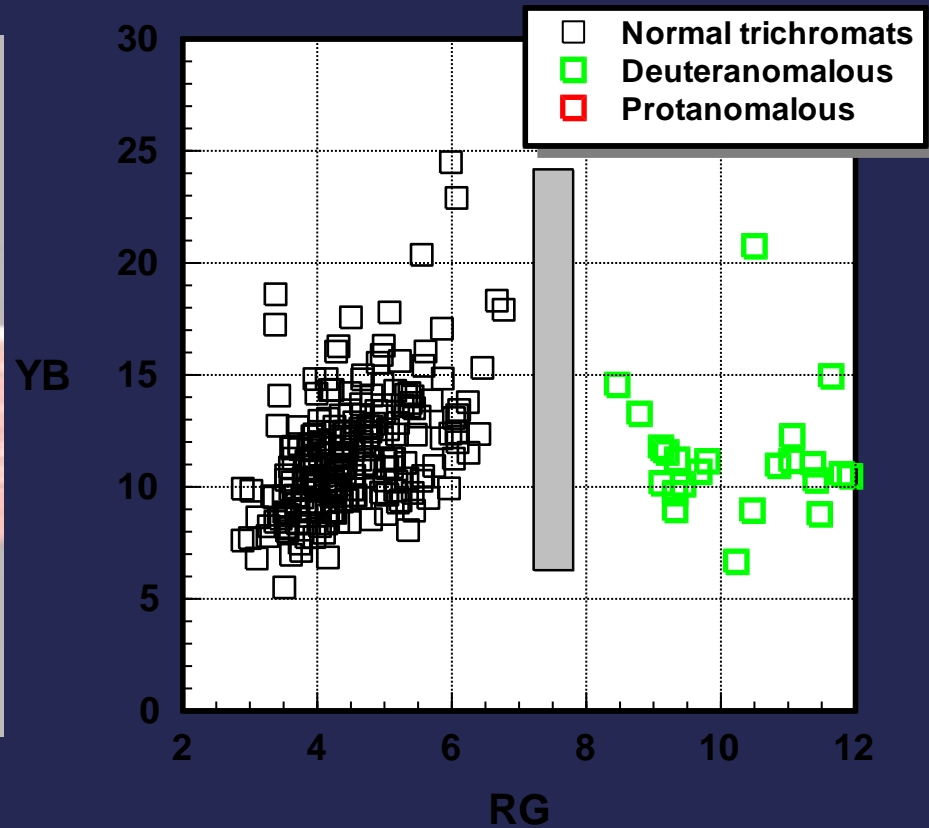

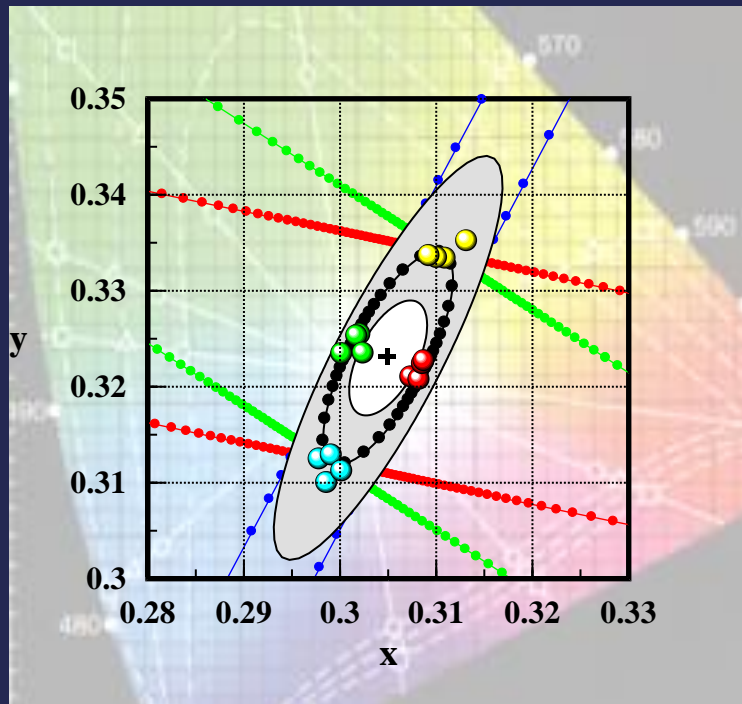

# MEASUREMENT OF COLOUR DISCRIMINATION

## The colour deficient subject

# MEASUREMENT OF COLOUR DISCRIMINATION

## The colour deficient subject

# The CAD test hardware

- Run from Laptop with second LCD calibrated screen with hood
- Bluetooth / wired keypad for patient responses

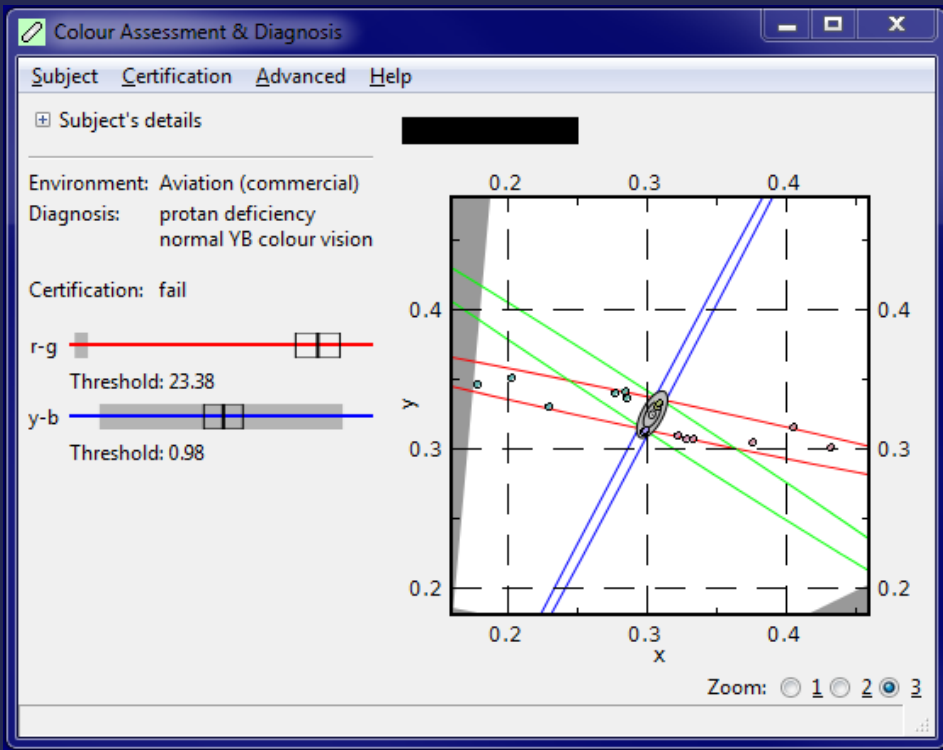

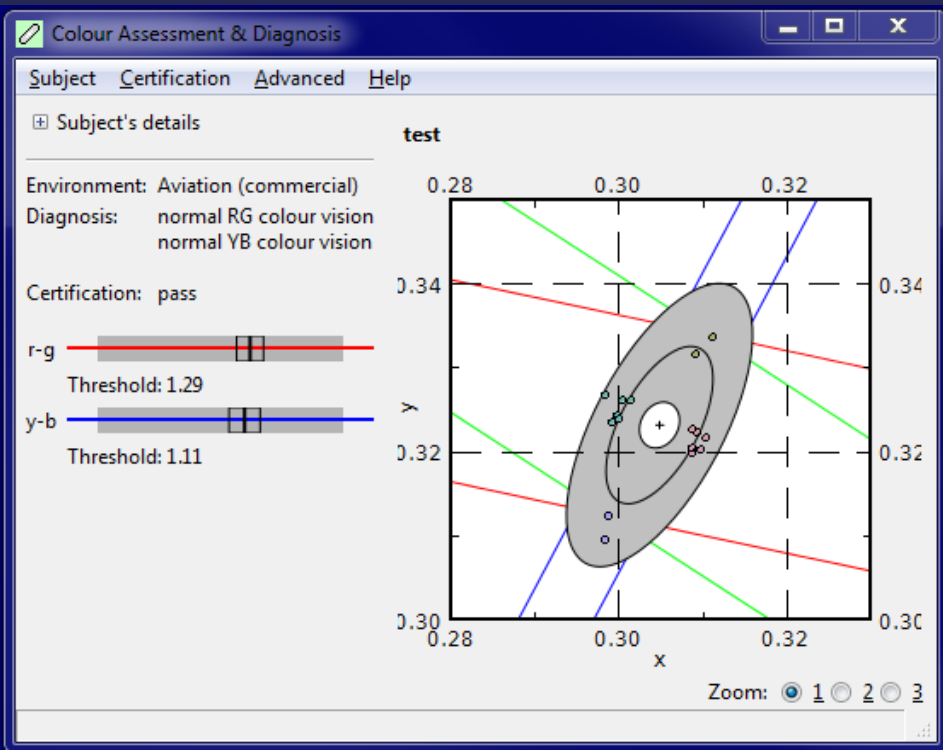

# Principal of CAD test

- Pixelated square area which has same overall luminance as background
- During presentation each pixel randomly alters luminance but overall luminance remains constant
- Colour signals are isolated and small square target presented at a particular saturation

# CAD test protocol

- Test distance 1.4m with applicant holding keypad
- Mesopic conditions
- Demo test to ensure test instructions understood
- Full threshold test 10-15 minutes
- 3 repeat (R-G only) tests where threshold borderline (up to certain levels of protan or deutan deficiency are acceptable for pilot certification)
- Applicant controls speed of test through speed of response on keypad
- Result print-out given to applicant
- Any further CAD thresholds are averaged with existing scores

# Output of test

# Practical Pros & Cons of the CAD

- Advantages:
  - Ability to diagnose and quantify level of colour vision deficiency
  - Repeatable and reliable
  - Subject can undertake CAD multiple times – all threshold results are averaged
  - Less examiner dependent
  - Less protocol dependent
  - Can be used as a screening test
- Disadvantages:
  - Time consuming if borderline result
  - Expense of hardware
  - Challenge for regulators determining 'safe' limit
