## Coarse fishing close season on English rivers

## Appendix 5 - Summary of coarse fish close season research proposals

\(\left.$$
\begin{array}{|l|l|l|l|l|l|}\hline \text { Review of APEM (2004) proposals } & & \begin{array}{l}\text { Indicative } \\
\text { cost }\end{array} & \text { Timescale } & \text { Pros } & \text { Cons } \\
\hline \text { Project title } & \text { Approach } & & \begin{array}{l}\text { Minimum 1 }\end{array} & \begin{array}{l}\text { Could provide evidence } \\
\text { on differential stress } \\
\text { response to capture } \\
\text { and handling at } \\
\text { different times of year } \\
\text { preferably } \\
\text { repeated. }\end{array} & \begin{array}{l}\text { Could only be for limited number of } \\
\text { species. No direct relationship } \\
\text { between stress response and } \\
\text { mortality or reproductive success. } \\
\text { Questionable relationship with wild } \\
\text { environments. Would be very } \\
\text { expensive at current prices. Some } \\
\text { indirect evidence in existing }\end{array}
$$ <br>

literature.\end{array}\right]\)| Investigation of <br> stress response <br> in cyprinid fish <br> during and <br> outside <br> breeding period |
| :--- |
| Laboratory -and <br> field-based based <br> experimental <br> studies - <br> measurement of <br> blood chemistry <br> in relation to <br> handling stress |
| $(2004$ prices) |

| without closed <br> seasons | performance in <br> similar English <br> and Irish rivers. <br> Desk study and <br> possible field visit |  | population <br> data from <br> English <br> and Irish <br> rivers - 12 <br> months <br> depending <br> on <br> availability <br> of Irish <br> data. | population size and <br> structure in rivers <br> which differed only in <br> closed season <br> arrangement | irrespective of angling. Angling <br> pressure in lrish systems relatively <br> light and localised. High variability <br> in time over both datasets. <br> Availability of Irish data may be an <br> issue. |
| :--- | :--- | :--- | :--- | :--- | :--- |

|  | angling <br> community |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Repetition of <br> comparative <br> studies on <br> canals where <br> closed season <br> removed in 2000 | Examination of <br> angling results <br> from canals <br> where closed <br> season lifted | £10k at 2004 <br> prices(if <br> delivered by <br> consultancy) | 6-12 <br> months | Could reveal whether <br> lifting of the closed <br> season has had <br> adverse impacts on <br> fish community or <br> population structure. <br> Relatively cheap if data <br> is available | Doubtful whether there are <br> sufficient good datasets to enable <br> good comparisons to be made. <br> Large changes in canal fisheries <br> anyway largely due to improving <br> water quality, therefore <br> comparisons difficult. Dynamics of <br> canal fish populations likely to differ <br> from rivers so limited extrapolation <br> possible |
| Effects of <br> angling for <br> salmonids on <br> coarse fish <br> populations <br> during | Questionnaire to <br> assess the level <br> of coarse fish <br> capture by <br> salmonid anglers <br> during coarse fish <br> closed season | £10k at 2004 <br> prices(if <br> delivered by <br> consultancy) <br> close season on <br> mixed <br> population <br> rivers. | Three <br> years <br> minimum | Could identify whether <br> coarse fish capture <br> during closed season <br> by salmonid anglers is <br> significant | Results would bear little relevance <br> to opening rivers for 12 month a <br> year bait fishing. Coarse fish are <br> caught by trout and salmon anglers <br> using fly and spinner but in <br> relatively small numbers, angling <br> pressure on mixed rivers by salmon <br> and trout anglers is negligible <br> compared to coarse angling. Only <br> for grayling in trout waters would <br> any sensible comparison be |
| relevant or possible. |  |  |  |  |  |

$\left.\begin{array}{|l|l|l|l|l|l|}\hline \text { Coarse fish closed season study group 2016 proposals } & \\ \hline \text { Project title } & \text { Approach } & \begin{array}{l}\text { Indicative } \\ \text { cost }\end{array} & \text { Timescale } & \text { Pros } & \text { Cons } \\ \hline \begin{array}{l}\text { Survival } \\ \text { experiments to } \\ \text { assess impacts } \\ \text { of fish capture } \\ \text { and handling } \\ \text { during coarse } \\ \text { fish closed } \\ \text { season on } \\ \text { rivers }\end{array} & \begin{array}{l}\text { Monitoring of } \\ \text { survival of } \\ \text { individual marked } \\ \text { fish caught at } \\ \text { different times of } \\ \text { year in selected } \\ \text { river reaches } \\ \text { where all-year } \\ \text { round match } \\ \text { angling permitted } \\ \text { by special } \\ \text { dispensation. }\end{array} & \begin{array}{l}\text { £50k per } \\ \text { annum }\end{array} & \begin{array}{l}\text { Minimum } \\ \text { three years }\end{array} & \begin{array}{l}\text { Could identify whether } \\ \text { fish caught and handled } \\ \text { at certain times of year } \\ \text { had consistently higher or } \\ \text { lower survival rates that } \\ \text { those caught at other } \\ \text { times of year. Good } \\ \text { opportunity for angler- } \\ \text { engagement. }\end{array} & \begin{array}{l}\text { Very few river reaches would fulfil } \\ \text { site criteria. Simulations suggest } \\ \text { that unless differences were very } \\ \text { large, unlikely to detect a difference } \\ \text { given high background variation in } \\ \text { natural survival rates, catchability, } \\ \text { river conditions etc. Would be } \\ \text { vulnerable to chance factors e.g. } \\ \text { extreme events. Would be relevant } \\ \text { to relatively few species. Could }\end{array} \\ \text { only be done on one river at once, }\end{array}\right\}$
$\left.\begin{array}{|l|l|l|l|l|l|}\hline \begin{array}{l}\text { In-river } \\ \text { behavioural } \\ \text { observation of } \\ \text { fish caught } \\ \text { during closed } \\ \text { season }\end{array} & \begin{array}{l}\text { Tagging and } \\ \text { tracking of large } \\ \text { chub, barbel, pike } \\ \text { and subsequent } \\ \text { capture on rod } \\ \text { and line. }\end{array} & \begin{array}{l}£ 30-60 \mathrm{k} \text { in } \\ \text { conducted } \\ \text { through 3 } \\ \text { year PhD, }\end{array} & \text { Three } \\ \text { years }\end{array} \quad \begin{array}{l}\text { Could indicate whether } \\ \text { capture by angling } \\ \text { impacts on movement to } \\ \text { known spawning areas } \\ \text { and participation in } \\ \text { spawning }\end{array}, \begin{array}{l}\text { Would only be practicable for } \\ \text { relatively small numbers of fish, } \\ \text { individual behaviour is highly } \\ \text { variable anyway. Would not provide } \\ \text { information as to actual spawning } \\ \text { success. Could only be done on } \\ \text { certain species and sizes in small } \\ \text { rivers. Some indirect information on } \\ \text { this already available via other } \\ \text { studies - barbel caught and tagged } \\ \text { early in the closed season } \\ \text { observed to move along with others } \\ \text { and take part in spawning. }\end{array}\right\}$
